Every time some jerk loudly tells everyone within ear shot that he can buy "X" radio at a much lower cost I offer to sell him one of those defective Amazon units at Amazon's price right then and there, of course showing him (and everyone else watching) a few of the problems with the Amazon purchased radio. I've yet to have one of them actually buy the defective unit.

I purchased a Puxing UV-973 and cross-band operation was easy. I also liked the radio quite a bit more than the Baofeng, so I bought a second. Only caveats are to run low power on both bands and use a dual band antenna with good SWR on both bands. Cross-band operation with Puxing was very nice.

More info on this. They have had problems with dope growers, poachers and smugglers so stop those with radios to see what they are up to.

I do not think they would do this to toy looking gmrs radios but if it looks like a Ham radio they might do this especially if reports of these illegal operations are going on. A large amount of drugs and illegal immigrants are coming across these areas or hiding in them.

Some wildfires during a drought was traced back to some of these activities too.

Someone stated they were questioned about their scanner too (person was scanning the Fish and Wildlife channels)

Subject: Re: [baofeng_uv5r] Normally this is great site with good info BUT.....

One thing some hiking groups told us when hiking in the National forest area inside S California was the fact that a ranger stopped them and asked if they had their Ham radio licenses.

Cannot verify this story, however I heard it in different versions so it is a possibility this might have happened. It is really easy to get a license and allows you to do much more with the radios, I would make it a family or group project and get everyone licensed so you can do even more using the Ham bands while enjoying the outdoors.

Subject: Re: [baofeng_uv5r] Normally this is great site with good info BUT.....

that's one of the issues...

you can buy frs..gmrs radios at kmart for $10.

it's a special at their b&m locations.

the Motorola's sell at Sam's club for around $70

as a consumer... i wanted to buy a good set of ht's for trips.

i have no HAM background or knew of any prior to my uv5r ownership.

i did my research and apparently did it well.

for about $55 shipped i received two uv5r's with charging bases..hands-free...aftermarket antennas in addition to the stock pieces.

these severely outperform the radio's mentioned...even radios that cost 3x much.

i went hiking with my radios on low power...WOW...

i made a good purchasing decision...a very good one.

frs..gmrs..murs all programmed with alpha labels on the radio using chirp.

i have recd very useful info here on this site to improve the hardware and accessories performance and about the law.

i only need this radio for the walkie function... i am not concerned about listening to air traffic our dx'ing.

i only want a good walkie. ...and yep even better...i recd an excellent set.

don't want to be licensed at the moment...

i only need these to be good walkies.. they get used minutes a month when going on hiking and recreational trips.

i am not bragging our encouraging.. these are excellent radios and i am using them on channels that are already hardwired into bubble packs.

to date..i operate on MURS channels when in the mountains.

THERE IS NO TRAFFIC ON THESE CHANNELS

which is perfect for my use...if an emergency happens... our one of our groups gets lost... the radios ate thete to maintain contact.

next goal is to find a radio that can tx..rx on CB bands as well as frs..gmrs..murs.

it would be hard to discern my uv5r from other bubble packs whem i am hiking.

i guess people walk around with equipment to measure the tx strength on radios... then report them tho the authorities or get on the channel and berate them with regulations.

if i am on one of the public license free channels and comm'ing with other groups on safety checks, and a licensed ham is perturbed.

its been stated here that THEY WILL STOP ME....THEY WILL MAKE ME STOP.

i am curious as to how that will be accomplished.

again. .. murs...frs...gmrs... this radio has handled them far superior then any Motorola i have come across.

i am not here to brag.

i am not here to twist your knickers... i am here about the uv5r.

if you HAMS dislike people using bubble packs on gmrs..frs....some even have murs...

write to the fcc..

until then i will continue to use the radios with out a license for now.

i am glad the HAMS in my area are congenial and polite regarding my purpose for these.

i enjoy this group and it has been very informative. THANK YOU

THANK YOU TO MIKLOR

On Jun 8, 2015 11:54 AM, "'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

Which is why some come to my table to yell at me and threaten to report me to the FCC for demo and selling radios. In the sense that we are the problem and cause of this. The first thing I say is “These are HAM radios that require a license to operate.” Our signs say HAM RADIOS. LICENSE Required a Free 4.7 GB DVD data disk is included in the radio box with all the rules and regulations, electronic courses, self study guides.

Along with the large number of study books, guides and disk on the table we still receive threats and face accusations for some type of violations. (All Coming from the Ham community)

We all wear badges with our call signs after being accused of selling radios unlicensed.

For those Hams out there that get angry when you see someone out in the public venue promoting Ham radio stuff either at show or swap meet, always remember this.

“Would you rather have a guy that is selling the radio explain the regulations, give warnings and provide step by step license instructions to a potential customer” (And having a policy of not selling to goofballs, kids, gang members and nut jobs)

or

“Would you rather have them buy a pair off Amazon and have them run on the Chinese test freq factory program instead OR start dialing in random numbers in freq mode for operation”?

I would rather have them on illegally on FRS/GMRS than on a repeater or on an important Public Safety freq. <--- lesser of 2 evils

When the prices are $30 and a pair at $60 you will soon find out that everyone will end up with one of these bought from the internet compared to a bubblepack pair that might cost more.

Using these radios illegally will NEVER stop when they can be found at $30 and from multiple sellers on the internet.

Tracking down kids playing airsoft on FRS/GMRS MURS with an UV5R would require a full time job (especially in this area)

The rules abuse will never end and will only get worse.

Subject:[baofeng_uv5r] Normally this is great site with good info BUT.....

As a LICENSED Ham Radio Op for over 60 years, I find some of the stuff generated on this site as deplorable, illegal and down right stupid! Any Legally Licensed Ham would not dare use FRS and GMRS frequencies in conjunction with Ham Radio Repeaters. IT IS ILLEGAL! I also noticed most of the commenters use names and not Ham Call Signs, this leads me to believe that a lot of illegal crap goes on here! One this all of you wanna be Hams should know, HAMS POLICE THEIR OWN FREQUENCIES and we don't stand for any crap! We will turn you in faster than ice cream melts on the sun (idiot terms for idiots). So go ahead, make your little repeaters and cross band FRS or GMRS onto it. Legal Hams will be knocking on your door, not asking you to stop, MAKING you stop! As for causing interference to Public Service Emergency Services, your out of your minds, you will be caught and pretty fast. Just think, your friend down the street messing with a repeater screwing up the EMCOMM Services and your family needs an Ambulance, Fire Truck or maybe a Cop because your house has your kids and wife by the throat, Yeah just think about it for a minute! These little Baofeng radios are pretty neat, but NOT in the hands of stupid people!

Subject: Re: [baofeng_uv5r] Re: BL-5 Battery - goes bang!

One other advantage of the TYT charger is that TYT remembers to correctly solder all the connections - something that the children working for BaoFeng forget rather too frequently.

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Monday, June 08, 2015 15:28 PM
To: baofeng_uv5r@yahoogroups.com
Subject: [baofeng_uv5r] Re: BL-5 Battery - goes bang!

Quick notes:

Baofeng charger is very good. It gives a 400mA charge, current limited, and then switches to a 40mA charge to 8.4 volts, then the charge terminates. Textbook charging, from the internal chip that was designed for the purpose.

Indeed, 90% charge will double the cycle life. I am not convinced that use below 40% is disadvantageous, although it is a good voltage to store unused batteries at. I have modified my Baofeng charger to terminate at 8.2 volts to give a 90% charge. (I detailed the mod in a post two or three weeks back, it is VERY simple).

The little digital meters I saw were connected to the voltage they were measuring. They will take more than the 6uA that the Baofeng charger gives when the charge has terminated. Of course, if they power up separately, and take a very high impedance input to measure with, then all well and good.

I bought a 3800mA battery recently. It came with a charger, that charged it to 8.5 volts. Which, if you charge a 3600 battery to 8.5 volts, you get 3800, and a lot less charge cycles. Crafty devils.....

Oh.. My laptop battery is half gone. And five years old. Probably cycled less than 50 times, and kept at 40%.

Like you, Ken, I am spending a lot of time and effort on a cheap radio. Because it is what we do... :-)

Don't like the TYT charger. It does not have the accurate charge rates like the Baofeng one. It does work in a car, engine running, but the charge rate is not as high as it should be, as the LM317 is thermally limiting. It does not even have a heatsink. I fitted a buck regulator in my Baofeng charger, and it accepts 12-28 volts, outputs 10 volts to the charge circuitry and does not get hot at all.

Regards and 73,

Stan.

Subject: Re: [baofeng_uv5r] Re: Hams and laws...

I used to take a hard line approach, but I'd see those same folks at the next show using their UV-5R's (and/or other Chinese radios) programmed for FRS, or GMRS, or MURS, etc., etc., after purchasing them on Amazon or e-Bay and then asking question after question (on this forum and others like it) on how to program their radio for FRS, or GMRS, or MURS anyway.

This is exactly what they do to us too. Worst ones want us to teach them how to full op police freqs for them too.

With so many folks on so many forum groups all too eager to help them get their radios on non-authorized frequencies anyway, and seeing the writing on the wall that there will always be some quick to jump in and help provide step by step instructions (including complete Chirp templates for FRS/GMRS/MURS, etc.), it seems pointless to keep swimming upstream as one of the few (and yes there still are a few) to point out the legality of using the radios outside of Part 90 or Part 97 services.

Perhaps with age I've mellowed out a bit (for example I used to always carry a full sized 1911, but now I carry a small Kahr 9mm at shows and usually only carry a Springfield XD Full Size for non-show weekends), but I always explain to the prospects that if "range" is their over-riding issue (99% of the time it is), they will always be able to talk further than their buddies (that appeals to their ego) with a simple Tech license.

Maybe in your old age you are a better shot and do not need a 1911 too bad we cannot CCW here in most places.

If time permits, I'll sometimes also show them really long distance conversations using IRLP as well, which normally causes a few of them to immediately ask "How are you doing that with such a small antenna?"

What we won't do is compete with the Chinese selling non-FCC Part 90 approved radios based on below dealer pricing. Our programming templates cost me time to develop, check and update. Radios we sell (all Part 90 approved) are tested before they ever see a customer, which takes both time and money for test equipment, shop space, etc.

Everyone else working always thinks they aren't paid enough for their skills (whether they be a Carpenter, Dentist, Doctor, Electrician, Mechanic, etc.) - yet those same individuals sometimes think everyone that's involved in what they consider a hobby (guns, radios, etc.) should sell stuff at cost (or below cost) and work for free. I disagree.

I actually got one of our customers (that purchased non-FCC Part 90 radios elsewhere) to let me have two of the most defective units that we use for display purposes at shows.

Every time some jerk loudly tells everyone within ear shot that he can buy "X" radio at a much lower cost I offer to sell him one of those defective Amazon units at Amazon's price right then and there, of course showing him (and everyone else watching) a few of the problems with the Amazon purchased radio. I've yet to have one of them actually buy the defective unit.

They will argue over $5 higher price than Amazon

This might be why a few weeks back my table attracted a couple of A-holes attempting to do a license spot check and threats to turn me into the FCC.

I never saw the guy but he claimed I told him he could talk on FRS/GMRS and whatever without a license- I never told ANYONE they could do this without a license. I found out this weekend others are selling them in nearby areas at the shows (from under the table no less) it is possible they are telling them this?

I lose customers that walk away as soon as I mention “License.” I would rather lose a customer then sell to someone not interested in doing things the right way.

YOU NEED a license is the first sentence I respond with when we have questions.

This helps to weed out those that do not want to get a license from us wasting our time explaining products. I would say 50% listen and ask questions then go buy online and I make it clear if they buy elsewhere we will not program them
when brought into the shows- which overwhelmed us in the past. We just cannot solve radio issues and watch table thefts at the same time.

Jim,

The vast majority of Chinese radio sellers portray the Chinese radios to whatever market they are attempting to sell into.

"If" Baofeng could only sell their Part 90 radios to folks with a commercial license or to hams, they would have long ago reached their sales levels and leveled out.

I've seen many Baofeng ads on Amazon and e-Bay (and at various hamfests) that market UV-5R's and UV-82's as "ham radios", but I've also seen loads of street sellers (usually at weekend events) program them with FRS/GMRS channels and then market the same radios as higher power "FRS/GMRS" radios.

50724. Need to buy a spare for my two year old UV-5R

Yahoo group: baofeng_uv5r (2015)

From: Michael D Earls
Topic: 50724 Message: 50724

I'd like to buy another cheap Baofeng, but avoid as many issues as possible.

Main Trading Co. promises that all in stock radios have the latest firmware.
But after reading about recent issues, is that a good thing?

Do any of the cheap models come with the A-V85 antenna?

Since I'll only use one radio at a time, I see no reason to buy another
upgrade antenna (have a NA-711).

Any benefit of the UV-82 over the UV-5R?

I have several spare batteries for the 5R. Batteries for the 82 are about
twice as much.

Leaning toward Amazon again (SBA) to save shipping.

One thing that would probably help would be if the creators of CHIRP removed the ability to so easily bring the MURS, GMRS, and FRS freqs into all of the different radios. Think about it. The only radios legal to be used on those freqs already have them built into the radios, and they cannot have other freqs entered into them. Jardy Dawson

From: mailto:baofeng_uv5r@yahoogroups.com Sent: Monday, June 08, 2015 6:10 PMTo: mailto:baofeng_uv5r@yahoogroups.com Subject: Re: [baofeng_uv5r] Re: Hams and laws... I used to take a hard line approach, but I'd see those same folks at the next show using their UV-5R's (and/or other Chinese radios) programmed for FRS, or GMRS, or MURS, etc., etc., after purchasing them on Amazon or e-Bay and then asking question after question (on this forum and others like it) on how to program their radio for FRS, or GMRS, or MURS anyway. This is exactly what they do to us too. Worst ones want us to teach them how to full op police freqs for them too.

With so many folks on so many forum groups all too eager to help them get their radios on non-authorized frequencies anyway, and seeing the writing on the wall that there will always be some quick to jump in and help provide step by step instructions (including complete Chirp templates for FRS/GMRS/MURS, etc.), it seems pointless to keep swimming upstream as one of the few (and yes there still are a few) to point out the legality of using the radios outside of Part 90 or Part 97 services.
Perhaps with age I've mellowed out a bit (for example I used to always carry a full sized 1911, but now I carry a small Kahr 9mm at shows and usually only carry a Springfield XD Full Size for non-show weekends), but I always explain to the prospects that if "range" is their over-riding issue (99% of the time it is), they will always be able to talk further than their buddies (that appeals to their ego) with a simple Tech license. Maybe in your old age you are a better shot and do not need a 1911 too bad we cannot CCW here in most places.

If time permits, I'll sometimes also show them really long distance conversations using IRLP as well, which normally causes a few of them to immediately ask "How are you doing that with such a small antenna?"

What we won't do is compete with the Chinese selling non-FCC Part 90 approved radios based on below dealer pricing. Our programming templates cost me time to develop, check and update. Radios we sell (all Part 90 approved) are tested before they ever see a customer, which takes both time and money for test equipment, shop space, etc.

Everyone else working always thinks they aren't paid enough for their skills (whether they be a Carpenter, Dentist, Doctor, Electrician, Mechanic, etc.) - yet those same individuals sometimes think everyone that's involved in what they consider a hobby (guns, radios, etc.) should sell stuff at cost (or below cost) and work for free. I disagree.

I actually got one of our customers (that purchased non-FCC Part 90 radios elsewhere) to let me have two of the most defective units that we use for display purposes at shows.

Every time some jerk loudly tells everyone within ear shot that he can buy "X" radio at a much lower cost I offer to sell him one of those defective Amazon units at Amazon's price right then and there, of course showing him (and everyone else watching) a few of the problems with the Amazon purchased radio. I recently got my radio and thus haven't run down the battery enought to warrant a charge. the other day when i did plug in the charger the LED was a solid green. It wasn't flickering to red either.

I tried placing the battery in the charger before turning it on but this hasn't helped either....

If i run down the radio I may not have any way of charging it....

What about Meter Maids in D.C. ? They are on Federal Lands.

I'd still ask for their authorization and to prove that I had actually transmitted instead of monitored.

Barney Fyffe in a Smokey Bear hat better have probable cause to search my backpack.

CHIRP is such a great program and the creators have done such an excellent job. They deserve a lot of credit. Thank you!

The idea of "policing' and tasking the CHIRP guys with a mission to "police" doesn't sit well with me. The radio isn't the culprit. Just as a gun doesn't shoot people, the radio doesn't break the law, ignorant or dumb ass operators do. Getting a license is easiest now than ever before. In spite of that There will always be those who won't follow the rules. Let's not get into the trap of controlling the majority of us law abiding citizens to get at the 3 percent who will probably break the law anyway. So the result is that the restrictions will apply only to the honest citizens. The criminals have no intention of following the rules.

Please do remember that MURS, (whatever that is), GMRS, (ditto – some extension of FRS IIUC) and FRS are not universal. In fact they don't exist outside the USA and the frequencies, whatever they are (don't really care) are assigned to other services, some of which are commercial.

We don't allow people to carry firearms in a public place unless they are Police. I've no doubt if we tried to enforce our laws about that in the US we would be greeted with contempt.

If you have laws and they are being broken, I suggest that you report it to the relevant authorities for enforcement instead of trying to make it difficult to program your pet frequencies.

No offence.

Geoff

One thing that would probably help would be if the creators of CHIRP removed the ability to so easily bring the MURS, GMRS, and FRS freqs into all of the different radios. Think about it. The only radios legal to be used on those freqs already have them built into the radios, and they cannot have other freqs entered into them.

Subject: Re: [baofeng_uv5r] Re: Hams and laws...

I used to take a hard line approach, but I'd see those same folks at the next show using their UV-5R's (and/or other Chinese radios) programmed for FRS, or GMRS, or MURS, etc., etc., after purchasing them on Amazon or e-Bay and then asking question after question (on this forum and others like it) on how to program their radio for FRS, or GMRS, or MURS anyway.

This is exactly what they do to us too. Worst ones want us to teach them how to full op police freqs for them too.

With so many folks on so many forum groups all too eager to help them get their radios on non-authorized frequencies anyway, and seeing the writing on the wall that there will always be some quick to jump in and help provide step by step instructions (including complete Chirp templates for FRS/GMRS/MURS, etc.), it seems pointless to keep swimming upstream as one of the few (and yes there still are a few) to point out the legality of using the radios outside of Part 90 or Part 97 services.

Perhaps with age I've mellowed out a bit (for example I used to always carry a full sized 1911, but now I carry a small Kahr 9mm at shows and usually only carry a Springfield XD Full Size for non-show weekends), but I always explain to the prospects that if "range" is their over-riding issue (99% of the time it is), they will always be able to talk further than their buddies (that appeals to their ego) with a simple Tech license.

Maybe in your old age you are a better shot and do not need a 1911 Smile too bad we cannot CCW here in most places.

If time permits, I'll sometimes also show them really long distance conversations using IRLP as well, which normally causes a few of them to immediately ask "How are you doing that with such a small antenna?"

What we won't do is compete with the Chinese selling non-FCC Part 90 approved radios based on below dealer pricing. Our programming templates cost me time to develop, check and update. Radios we sell (all Part 90 approved) are tested before they ever see a customer, which takes both time and money for test equipment, shop space, etc.

Everyone else working always thinks they aren't paid enough for their skills (whether they be a Carpenter, Dentist, Doctor, Electrician, Mechanic, etc.) - yet those same individuals sometimes think everyone that's involved in what they consider a hobby (guns, radios, etc.) should sell stuff at cost (or below cost) and work for free. I disagree.

I actually got one of our customers (that purchased non-FCC Part 90 radios elsewhere) to let me have two of the most defective units that we use for display purposes at shows.

Every time some jerk loudly tells everyone within ear shot that he can buy "X" radio at a much lower cost I offer to sell him one of those defective Amazon units at Amazon's price right then and there, of course showing him (and everyone else watching) a few of the problems with the Amazon purchased radio. I've yet to have one of them actually buy the defective unit.

They will argue over $5 higher price than Amazon

I never saw the guy but he claimed I told him he could talk on FRS/GMRS and whatever without a license- I never told ANYONE they could do this without a license. I found out this weekend others are selling them in nearby areas at the shows (from under the table no less) it is possible they are telling them this?

I lose customers that walk away as soon as I mention “License.” I would rather lose a customer then sell to someone not interested in doing things the right way.

YOU NEED a license is the first sentence I respond with when we have questions.

This helps to weed out those that do not want to get a license from us wasting our time explaining products. I would say 50% listen and ask questions then go buy online and I make it clear if they buy elsewhere we will not program them

when brought into the shows- which overwhelmed us in the past. We just cannot solve radio issues and watch table thefts at the same time.

Jim,

The vast majority of Chinese radio sellers portray the Chinese radios to whatever market they are attempting to sell into.

"If" Baofeng could only sell their Part 90 radios to folks with a commercial license or to hams, they would have long ago reached their sales levels and leveled out.

I've seen many Baofeng ads on Amazon and e-Bay (and at various hamfests) that market UV-5R's and UV-82's as "ham radios", but I've also seen loads of street sellers (usually at weekend events) program them with FRS/GMRS channels and then market the same radios as higher power "FRS/GMRS" radios.

MURS is several (probably total of five) frequencies which
are used by contractors, road crews, and other working
people. The handi talkies are sold at wholesale houses,
and used by working people who need to talk to other
workers on the job. I've seen them used by road repair people,
drain and sewer workers.

The radios often have colored dots so the crew can be all
on the same frequency. One was about 151 megs, another
about 154 megs, and one was in the 450 megs range.

Thank you sir. I don’t think we have an equivalent, crews like you describe either have a commercial channel or two (usually vhf) or use UHF CB (which is now 80 channel narrowband in the 476/477mhz range and not at all crowded.)

450/451mhz and 150/151mhz is a mix of govt and commercial users.

I've met road crews in the US, who used to (twenty or more
years ago) use CB radio in the US. 27 mHZ band, AM
modulation.

Now days, the short range FRS (460 and 465 meg range)
are used by some road crews.

A pleasure to meet you.

From: Christopher Young
Topic: 50636 Message: 50740

My memory of UHF MURS goes back about twenty
some or more years. Very possible that i'm mistaken,
or maybe they changed.

In any case, you are correct in that NOW date, the
MURS sets are on VHF.

They should do fine for the mile or so that most
contractors need.

MURS was created around 2000 or 2001 and was never on UHF.
The closest thing would be FRS on 462/467 MHz which was created in the
mid 1990s.

Years ago, I had a paper catalog from Grainger, which was
maybe four inches thick. I remember they had Jobcom
handi talkies, with color dots and the freq listed. Some how
I thought I remembered UHF jobcoms. Of coure, that's a long
time ago, and memory can fade.

Now, they are VHF, and maybe that's what is important?

We've had the UHF CB system since the late 70s. It was intended to replace the US style 27mhz system (which was not legal here for some years after its use became widespread.) The govt wasn't happy but shrugged and legalised it, charging for individual licenses. Well, that got old real quick, policing that was costing more than licensing revenue. They bought in UHF CB with 40 channels, with the intent of phasing out 27mhz, but never quite got around to it. At some point they both became 'Class' licenses for type approved equipment. So we have both, only difference is that UHF CB went narrowband a year or so back. Again, they plan to phase out the wideband sets, but given that some Philips FM320s that came out in the 70s are still working, that probably won't be enforced or more likely just left alone. You don't need any kind of license if you have type approved radios. 5w max out of the radio, but you can use all the antenna gain you can manage to hang off it. There are also repeaters scattered around, they need to be individually licensed and must have standby power and must be public access. Local repeater is on the ranges near the ham repeaters and has about a 60 mile radius of coverage.

Lot of businesses don't bother with anything else. Outside the major cities, it's dead as a dodo on 90% of the channels, 90% of the time.

Couple of channels are reserved for data, mostly remote control of things like pumps and such on stations (ranches) and telemetry for the same – tells you if a cattle trough has water in it and if the pumps working, stuff like that. Packet is forbidden unfortunately, some (very limited) geolocation is now permitted, but it's something like 30secs of transmission per HOUR, so no APRS in realtime or anything like it.

Nice to meet you too Chris.

Cheers

Geoff

Yes, Jobcom and others made "bubble pack business radios" that came with a license application for Business Radio Service itinerant frequencies that don't require frequency coordination.

The "Color Dot" channels are a mix of business, GMRS and what is now two of the MURS channels. "Color Dot" does not equal MURS or license free. I don't know if any manufacturers still use the color coded freqeucny designations.
You can find the list at
<http://wiki.radioreference.com/index.php/Common_Itinerant_and_Business>.

From: Christopher Young
Topic: 50636 Message: 50745

I don't know how much range you can get on 5 watts of
UHF, but back in my 27 meter days I did some range
tests. Not all that great, biut enough to keep me ammused.

CB also had major problems with skip, and cross
channel. There were days when I could hear radios
from out of state. And if another radio was too near,
I'd be able to hear him several channels away.

The UHF radios sound good, from here. And finding a
few open channels must be good.

Jobcoms did aparently have UHF models,
but that doesn't make em MURS. Might be
what I remembered?

UHF models

JMX-441D
450-470MHz
1 Watt Transmit Power
Battery Life: 9 Hrs.
Line-of-Sight Range: Up to 2 Miles
Coverage: Up to 10 Floors or 175,000 sq. ft.

JMX-446D
450-470MHz
2 Watts Transmit Power
Battery Life: 11.9 Hrs.
Line-of-Sight Range: Up to 2-4 Miles
Coverage: Up to 20 Floors or 275,000 sq. ft.

JMX-444D
450-470MHz
3 Watts Transmit Power
Battery Life: 11.2 low/8 high Hrs.
Line-of-Sight Range: Up to 2-5 Miles
Coverage: Up to 25 Floors or 280,000 sq. ft.

Size and Weight Specs:
4.75" x 2.2"x 1.43" -11.5 oz with battery.

27 meter? Did you mean 11 meter?

Think you mean 27mhz ie 11 metres. I started on that myself.

My record for 27mhz was South Australia to Alaska, on a base rig with a half wave vertical in the mid 70s.

Range on UHF mostly depends on line of sight, but we certainly chatted across Spencer Gulf on both 27mhz and UHF (about 20nm) quite readily from car to car. We'd park on an embankment towards the coast and people in Whyalla on the other side of the gulf would park on the foreshore and you'd get 'em loud and clear.

Splatter from nearby rigs was an issue. I remember putting a pad into my HyGain 5 (which I've still got here somewhere) to reduce strong local signals as they would cause distortion.

Considering what the little Baofeng does in such a small footprint compared to the radios of 'the day' demonstrates how far we've come in some areas.

Subject: [baofeng_uv5r] CB in USA and Aus

I don't know how much range you can get on 5 watts of
UHF, but back in my 27 meter days I did some range
tests. Not all that great, biut enough to keep me ammused.

CB also had major problems with skip, and cross
channel. There were days when I could hear radios
from out of state. And if another radio was too near,
I'd be able to hear him several channels away.

The UHF radios sound good, from here. And finding a
few open channels must be good.

Well, I used the number 27 in reference to US version of
CB. That number 27 has got to mean some thing. I'll
think of it some day.

27, 27. Still thinking.

You just had this on your test.

27 mhz = 11m

wavelength = 300 / frequency in MHz
frequency = 300 / wavelength in meters

300 / 27mHz = 11.11 meters

Well, let me toss this idea into this "can of worms ".
In a disaster, or S&R situation, it might be useful to monitor all forms of radio communication, including FRS. Doesn't mean one has to transmit, although it would be allowable under the emergency situation exemption. Why limit the ability to program in and monitor. A lot of unlicensed fools do stupid things on motorcycles, but we haven 't banned motorcycles. (Yet).
CHIRP is a tool, not an enforcer.
YMMD. :)

> CHIRP is such a great program and the creators have done such an excellent job. They deserve a lot of credit. Thank you!
>
> The idea of "policing' and tasking the CHIRP guys with a mission to "police" doesn't sit well with me. The radio isn't the culprit. Just as a gun doesn't shoot people, the radio doesn't break the law, ignorant or dumb ass operators do. Getting a license is easiest now than ever before. In spite of that There will always be those who won't follow the rules. Let's not get into the trap of controlling the majority of us law abiding citizens to get at the 3 percent who will probably break the law anyway. So the result is that the restrictions will apply only to the honest citizens. The criminals have no intention of following the rules.

I thought I had replied only to Rich, but my mistake. Now that some of these ideas are out in the open, I'll try to address some of the points you guys have made.

Rich, I carry 9mm now (vs. the various 1911's I've owned in years past) primarily due to:

a) lighter overall gun weight with ammo,
b) 9mm ammo now has much more lethal capability than it did 10-15 years ago, and
c) my XD holds a total of 18+1 rounds, giving me far more ability to protect myself or family if (and I strongly hope this never happens) I have to use it.

After all, when seconds count, the Police are only minutes away (in my town their average response time is 4.5 minutes). We all know that a lot of bad things can happen in 4.5 minutes.....

Now for some of the other comments. Yes, in general I agree that less government intervention is better than more government intervention. I agree that guns don't kill people, cars don't kill people, both are just tools, etc., but I also think that you should not leave a loaded gun or a running car in a crowd full of folks on a weekend night and not expect any issues either.

The argument (that some make) about Chirp being only a tool (to me at least) is the same thing. Pre-loaded frequency templates (that aren't listen only) for various bands that allow instant transmission on U.S. FRS, GMRS, MURS, or Marine bands is like expecting children in a toy store to not touch anything when the parents aren't watching - it's simply not going to happen.

I rarely see a licensed ham carrying a Chinese radio without at least "some" FRS, GMRS, MURS, or Marine frequencies programmed into their Baofeng, TYT, Wouxun, etc. None of those (to date) have been programmed as "listen only". What ham is seriously going to use FRS in a true "emergency"? Everyone of these guys will admit to using his HT to talk to the kids down the street, or while camping, etc. Knowing many folks involved in EMCOMM, if even 10% of the licensed hams that claim they need FRS, GMRS, MURS, etc. programmed into their Chinese radios "just in case of emergency" actually got involved with EMCOMM - we'd have a whole lot more trained and skilled operators available when an actual emergency arises.

Mind you, I understand why they are listed at Chirp (because so many folks want them), but to pretend that those templates don't help encourage many folks to transmit with 4-5 watts on bands (where they shouldn't) is just sticking your head in the sand. Of course it's going to happen, and we all

know it will. You only have to read the questions in various internet forums for 48 hours to see many examples of it.

I'm afraid that the announcement the FCC is closing the majority of their field offices will only make the on the air situation worse over time, as I think Rich is already seeing in southern CA. Honestly, that may be a hidden reason why so many public service folks have gone digital (although they would probably never admit it). Digital radios are far more costly and take much more effort to program, thus the chances of some street thug ordering one from Amazon and messing with his local LEO is far less likely. And yes, I'm quite aware of various federal mandates and grants to get agencies P.25 compliant, as I said, going digital may also have a "hidden benefit" to these agencies - the lack of unauthorized clowns messing with their communications.

The point I was trying to make with Rich is that we advise the customer, and program what they want into the radio after providing them with various warnings and legal notices. We try really hard to make them see the multiple advantages of ham radio vs. FRS, GMRS, MURS, etc. - including bundling in Tech license training guides with radios that we sell. When they tell us they just want to listen, we just program in those channels with no transmit capability. Thankfully, we haven't had any requests to program in Police transmit frequencies (yet), but I'm sure that day will come. Most of our local departments have already moved into 800MHz digital units, so I think the cost of that equipment will deter 99% of the clowns that just want to mess with local Police communications.

The ERP (which is what the limit refers to) is likely to be considerably
less.

Not likely at half a watt.

I agree. I am firmly of the attitude of "If you're going to do it, do it
right", which means I don't particularly worry about a particular user
having the correct paperwork or the specified equipment, but I do worry
about them keeping within the specified parameters regarding power,
frequency, interference, operating procedure, and so on.

If someone is amenable to being told how to operate correctly, that is
better than having their back put up - and they may well go on to become
licenced (all the people I know who started off using fake callsigns
subsequently went legal).

As an aside, it used to be said, with some truth, that spotting
"pirates" on the amateur bands was easy, they were the ones who did
everything by the book!

> It may well be that using "non-approved" radios is not perhaps within
> the letter of the rules, although how one discovers whether a radio has
> approved status is not entirely clear to me.

I suppose it is buried in Ofcom's documentation somewhere, but it might
be a case of asking them specifically of Model X is approved for service
Y (and waiting for them to find the right person who knows).

You said...

"...although it would be allowable under the emergency situation exemption."

There is nothing in any part of the federal regulations that says an amateur radio operator can transmit outside of the ham bands, even in an emergency (except on 2 specific frequencies in Alaska). In other words, there is no "emergency situation exemption".

What the Part 97 rules (97.401, 403, 405) (which apply ONLY to amateur radio communications) do say is that you can operate outside of your license privileges in an emergency. In other words, for example, a Tech could do phone in the Extra part of the spectrum. Part 90 rules (90.407) covers Part 90 emergency communications.

There are specific rules in each Part of the regulations, which apply to those parts. You can't apply a Part 90 statement to Part 97, and you can't apply a Part 97 statement to Part 90. Also read Part 2, which clearly excludes amateur radio from many emergency operation situations (2.405).

One thing that would probably help would be if the creators of CHIRP removed the ability to so easily bring the MURS, GMRS, and FRS freqs into all of the different radios. Think about it. The only radios legal to be used on those freqs already have them built into the radios, and they cannot have other freqs entered into them.

MURS is several (probably total of five) frequencies which
are used by contractors, road crews, and other working
people. The handi talkies are sold at wholesale houses,
and used by working people who need to talk to other
workers on the job. I've seen them used by road repair people,
drain and sewer workers.

The radios often have colored dots so the crew can be all
on the same frequency. One was about 151 megs, another
about 154 megs, and one was in the 450 megs range.

My memory of UHF MURS goes back about twenty
some or more years. Very possible that i'm mistaken,
or maybe they changed.

In any case, you are correct in that NOW date, the
MURS sets are on VHF.

They should do fine for the mile or so that most
contractors need.

Date: Mon, 8 Jun 2015 22:54:06 -0500
Subject: [baofeng_uv5r] Need to buy a spare for my two year old UV-5R

I'd like to buy another cheap Baofeng, but avoid as many issues as possible.

Main Trading Co. promises that all in stock radios have the latest firmware. But after reading about recent issues, is that a good thing?

Do any of the cheap models come with the A-V85 antenna?

Since I'll only use one radio at a time, I see no reason to buy another upgrade antenna (have a NA-711).

Any benefit of the UV-82 over the UV-5R?

I have several spare batteries for the 5R. Batteries for the 82 are about twice as much.

I'd like to buy another cheap Baofeng, but avoid as many issues as possible.

Main Trading Co. promises that all in stock radios have the latest firmware. But after reading about recent issues, is that a good thing?

Do any of the cheap models come with the A-V85 antenna?

Since I'll only use one radio at a time, I see no reason to buy another upgrade antenna (have a NA-711).

Any benefit of the UV-82 over the UV-5R?

I have several spare batteries for the 5R. Batteries for the 82 are about twice as much.

The BF-F8HP still shows the same price of $62.89 on my browser - as of 5:36PM MST. There are two other choices you might also want to look at as well. One is the BF-F9V2+ or the TYT TH-UV8000D, both of which have the FCC Part 90 certification that the BF-F8HP lacks. I'll leave the rest of the comparisons to you.

  You said...

"...although it would be allowable under the emergency situation exemption."

There is nothing in any part of the federal regulations that says an amateur radio operator can transmit outside of the ham bands, even in an emergency (except on 2 specific frequencies in Alaska). In other words, there is no "emergency situation exemption".

What the Part 97 rules (97.401, 403, 405) (which apply ONLY to amateur radio communications) do say is that you can operate outside of your license privileges in an emergency. In other words, for example, a Tech could do phone in the Extra part of the spectrum. Part 90 rules (90.407) covers Part 90 emergency communications.

There are specific rules in each Part of the regulations, which apply to those parts. You can't apply a Part 90 statement to Part 97, and you can't apply a Part 97 statement to Part 90. Also read Part 2, which clearly excludes amateur radio from many emergency operation situations (2.405).

> I'm doing this as we had a rescue last year in a hilly area where the repeater we put up at 50ft wasn't high enough and the terrain mapping I've done shows 500ft should be able to get everywhere we need to go.

Now _/*that*/_'s an interesting and fun project ... some questions, please?

Will you be using the 500g latex, and what's your source for meteorological balloons?

What tethering line will you be using to minimize weight, and hence attainable elevation?

... and I'm sure you've already considered the FAA 500' minimum terrain elevation wrt tethering in hilly country. Some cowboy yayhoo pilots like to keep that planetary separation over flat land where people are watching, and then ignore it to give the passengers a thrill over some hilly country, and some news-crew helicopter-drivers think the rules don't apply to them in "the wilds". One would certainly want to make any such tethered device as visible as possible, perhaps by using long red/silver foil strips available from orchard supply shops.

Your project inspires me in terms of county ARES/RACES capability enhancement, thank you.

The experience you are having with the FCC now (or beginning to have) is similar to what happened here at the end of the CB license era.

Going back a little further, it was also a requirement to have a 'Broadcast Listener's License' (similar to the UK) to watch TV and listen to the radio. (Seriously!)

There was a small army of 'Radio Inspectors' that would do house to house doorknocks from time to time to enforce this and fine people if they had a tv or radio and no license. This eventually got howled down as unfair and the govt in it's wisdom withdrew the requirement.

IN the early 70's, various retailers started importing US 27Mhz 23ch CB radios into Oz. It wasn't illegal to import them, or even to own one under the (then) current regulations (Wireless Telegraphy Act of 1910 – yes really) and they were openly sold. Hams could in fact legally use them as the 11m US CB band was in fact a Ham Band in Australia at the time (indeed early Yaesu FT10xs had 11m installed at the factory – I still have an FT100 (older hybrid) with that band in it.

Naturally the great unwashed hordes hit on this as a means of free communications as there was nothing like that in Oz and of course this is well before the mobile phone era. Truckies in particular got stuck into this for much the same purposes as in the US (speed traps etc) and when the govt took notice, they turned that small army of inspectors onto busting people with CB gear all over the place. Meantime there were a few incidents where CB was used to preserve life by passing information about accidents and there was a groundswell of public opinion to legalise it. There were even protest songs on the radio about it! There was considerable resistance from govt and hams, who were seemingly intent to hang on to their unique position as licensed radio operators and saw CB as a threat to their recruitment base. (Some old hams still feel this way, however there are also many hams – me for instance – that in part got into hamming from CB.)

Well, it was a struggle that vacillated back and forth for a while, but the cost of maintaining the fleet of radio inspectors and increasing public opinion caused them to try to both redirect it to new, legal UHF system (which was actually very forward thinking for the era – hams were horrified that it would have things like repeaters – for instance) then finally license 27mhz (with some exceptions – at the time hospital pagers used 27mhz (yeah I know) so some channels were excluded and they came up with an Aus only 18ch system (you could use 23ch gear but not some channels) however this was blithely ignored and fairly quickly pagers moved to VHF out of the way, and the 40ch system was eventually approved. For a time it required individual licenses, but the flood tide of radio interference that was predicted never really happened (mostly it was from fringe areas) and the army of inspectors really had little to do once the licensing was replaced by a class license. So most of them got put off/redeployed etc.

I think you are about to hit that point. They seem to concentrate now on people using ham gear on 27mhz to some degree (because of interference to other services) but mostly the are only interested in interference to TV, commercial radio operation (which is a pay me thing) and essential services or military frequencies. A couple of recent examples of people using

police frequencies to harass cops interstate were ruthlessly tracked down and nailed to crosses. Doesn’t seem to be a problem in this state, since the police here long ago moved to a digital trunking system with mil grade encryption – you can’t monitor them unless you are ASIO. I think there are 3 radio inspectors in the whole state now, and despite being a ham for many years have never even met one, but it saves a lot of money and I suspect your FCC is heading down that path to at least some degree.

UHF CB is prolific, though not as much as it was about 20 years ago, mobile phones have taken over the niche it held for a while with young adults. Internet has displaced the hook of 27mhz skip (not to mention ham radio to some degree). The loc al repeaters (ham and cb) are quiet 90% of the time. I live in the country (18,000 pop) and the big cities are more congested – usual lids and music BS scattered around, though even that’s a lot less than 20 years ago.

Radio seems to be much less of a big deal now. Recently they started moving a lot of commercial and other stuff (wireless microphones being a particularly unpopular one) to make room so that they could sell a portion of the spectrum for new mobile phone and data services that are hungry for bandwidth.

A portion of the 1.2Ghz ham band went as well. We never had 220mhz here – that was – and is – VHF tv.

The Baofengs have revived a certain amount of ham activity and – technically illegally since they are not type approved radios – and portable uhf cb activity since they can easily cope with the (new) 80ch narrowband arrangement as well as the original 40ch one (no new frequencies from this, they just cut the channel width in half and put the extra 40ch in the gaps). Since both types of radio are legal to use (for at least another 3 years) there are obvious(!) issues but the govt doesn’t seem to care. To be honest, most CB users, such as they are, don’t seem to care much either.

Geoff

Subject: Re: [baofeng_uv5r] Re: Hams and laws...

I thought I had replied only to Rich, but my mistake. Now that some of these ideas are out in the open, I'll try to address some of the points you guys have made.

Rich, I carry 9mm now (vs. the various 1911's I've owned in years past) primarily due to:

a) lighter overall gun weight with ammo,
b) 9mm ammo now has much more lethal capability than it did 10-15 years ago, and
c) my XD holds a total of 18+1 rounds, giving me far more ability to protect myself or family if (and I strongly hope this never happens) I have to use it.

After all, when seconds count, the Police are only minutes away (in my town their average response time is 4.5 minutes). We all know that a lot of bad things can happen in 4.5 minutes.....

Now for some of the other comments. Yes, in general I agree that less government intervention is better than more government intervention. I agree that guns don't kill people, cars don't kill people, both are just tools, etc., but I also think that you should not leave a loaded gun or a running car in a crowd full of folks on a weekend night and not expect any issues either.

The argument (that some make) about Chirp being only a tool (to me at least) is the same thing. Pre-loaded frequency templates (that aren't listen only) for various bands that allow instant transmission on U.S. FRS, GMRS, MURS, or Marine bands is like expecting children in a toy store to not touch anything when the parents aren't watching - it's simply not going to happen.

I rarely see a licensed ham carrying a Chinese radio without at least "some" FRS, GMRS, MURS, or Marine frequencies programmed into their Baofeng, TYT, Wouxun, etc. None of those (to date) have been programmed as "listen only". What ham is seriously going to use FRS in a true "emergency"? Everyone of these guys will admit to using his HT to talk to the kids down the street, or while camping, etc. Knowing many folks involved in EMCOMM, if even 10% of the licensed hams that claim they need FRS, GMRS, MURS, etc. programmed into their Chinese radios "just in case of emergency" actually got involved with EMCOMM - we'd have a whole lot more trained and skilled operators available when an actual emergency arises.

Mind you, I understand why they are listed at Chirp (because so many folks want them), but to pretend that those templates don't help encourage many folks to transmit with 4-5 watts on bands (where they shouldn't) is just sticking your head in the sand. Of course it's going to happen, and we all know it will. You only have to read the questions in various internet forums for 48 hours to see many examples of it.

I'm afraid that the announcement the FCC is closing the majority of their field offices will only make the on the air situation worse over time, as I think Rich is already seeing in southern CA. Honestly, that may be a hidden reason why so many public service folks have gone digital (although they would probably never admit it). Digital radios are far more costly and take much more effort to program, thus the chances of some street thug ordering one from Amazon and messing with his local LEO is far less likely. And yes, I'm quite aware of various federal mandates and grants to get agencies P.25 compliant, as I said, going digital may also have a "hidden benefit" to these agencies - the lack of unauthorized clowns messing with their communications.

The point I was trying to make with Rich is that we advise the customer, and program what they want into the radio after providing them with various warnings and legal notices. We try really hard to make them see the multiple advantages of ham radio vs. FRS, GMRS, MURS, etc. - including bundling in Tech license training guides with radios that we sell. When they tell us they just want to listen, we just program in those channels with no transmit capability. Thankfully, we haven't had any requests to program in Police transmit frequencies (yet), but I'm sure that day will come. Most of our local departments have already moved into 800MHz digital units, so I think the cost of that equipment will deter 99% of the clowns that just want to mess with local Police communications.

On Tue, Jun 9, 2015 at 12:14 PM, Greg lewiswriter@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Well, let me toss this idea into this "can of worms ".

In a disaster, or S&R situation, it might be useful to monitor all forms of radio communication, including FRS. Doesn't mean one has to transmit, although it would be allowable under the emergency situation exemption. Why limit the ability to program in and monitor. A lot of unlicensed fools do stupid things on motorcycles, but we haven 't banned motorcycles. (Yet).

CHIRP is a tool, not an enforcer.

YMMD. :)

CHIRP is such a great program and the creators have done such an excellent job. They deserve a lot of credit. Thank you!

The idea of "policing' and tasking the CHIRP guys with a mission to "police" doesn't sit well with me. The radio isn't the culprit. Just as a gun doesn't shoot people, the radio doesn't break the law, ignorant or dumb ass operators do. Getting a license is easiest now than ever before. In spite of that There will always be those who won't follow the rules. Let's not get into the trap of controlling the majority of us law abiding citizens to get at the 3 percent who will probably break the law anyway. So the result is that the restrictions will apply only to the honest citizens. The criminals have no intention of following the rules.

Subject: Re: [baofeng_uv5r] Re: Hams and laws...

I used to take a hard line approach, but I'd see those same folks at the next show using their UV-5R's (and/or other Chinese radios) programmed for FRS, or GMRS, or MURS, etc., etc., after purchasing them on Amazon or e-Bay and then asking question after question (on this forum and others like it) on how to program their radio for FRS, or GMRS, or MURS anyway.

This is exactly what they do to us too. Worst ones want us to teach them how to full op police freqs for them too.

With so many folks on so many forum groups all too eager to help them get their radios on non-authorized frequencies anyway, and seeing the writing on the wall that there will always be some quick to jump in and help provide step by step instructions (including complete Chirp templates for FRS/GMRS/MURS, etc.), it seems pointless to keep swimming upstream as one of the few (and yes there still are a few) to point out the legality of using the radios outside of Part 90 or Part 97 services.

Perhaps with age I've mellowed out a bit (for example I used to always carry a full sized 1911, but now I carry a small Kahr 9mm at shows and usually only carry a Springfield XD Full Size for non-show weekends), but I always explain to the prospects that if "range" is their over-riding issue (99% of the time it is), they will always be able to talk further than their buddies (that appeals to their ego) with a simple Tech license.

Maybe in your old age you are a better shot and do not need a 1911 too bad we cannot CCW here in most places.

If time permits, I'll sometimes also show them really long distance conversations using IRLP as well, which normally causes a few of them to immediately ask "How are you doing that with such a small antenna?"

What we won't do is compete with the Chinese selling non-FCC Part 90 approved radios based on below dealer pricing. Our programming templates cost me time to develop, check and update. Radios we sell (all Part 90 approved) are tested before they ever see a customer, which takes both time and money for test equipment, shop space, etc.

Everyone else working always thinks they aren't paid enough for their skills (whether they be a Carpenter, Dentist, Doctor, Electrician, Mechanic, etc.) - yet those same individuals sometimes think everyone that's involved in what they consider a hobby (guns, radios, etc.) should sell stuff at cost (or below cost) and work for free. I disagree.

I actually got one of our customers (that purchased non-FCC Part 90 radios elsewhere) to let me have two of the most defective units that we use for display purposes at shows.

Every time some jerk loudly tells everyone within ear shot that he can buy "X" radio at a much lower cost I offer to sell him one of those defective Amazon units at Amazon's price right then and there, of course showing him (and everyone else watching) a few of the problems with the Amazon purchased radio. I've yet to have one of them actually buy the defective unit.

They will argue over $5 higher price than Amazon

This might be why a few weeks back my table attracted a couple of A-holes attempting to do a license spot check and threats to turn me into the FCC.

I never saw the guy but he claimed I told him he could talk on FRS/GMRS and whatever without a license- I never told ANYONE they could do this without a license. I found out this weekend others are selling them in nearby areas at the shows (from under the table no less) it is possible they are telling them this?

I lose customers that walk away as soon as I mention “License.” I would rather lose a customer then sell to someone not interested in doing things the right way.

YOU NEED a license is the first sentence I respond with when we have questions.

This helps to weed out those that do not want to get a license from us wasting our time explaining products. I would say 50% listen and ask questions then go buy online and I make it clear if they buy elsewhere we will not program them

when brought into the shows- which overwhelmed us in the past. We just cannot solve radio issues and watch table thefts at the same time.

Jim,

The vast majority of Chinese radio sellers portray the Chinese radios to whatever market they are attempting to sell into.

"If" Baofeng could only sell their Part 90 radios to folks with a commercial license or to hams, they would have long ago reached their sales levels and leveled out.

I've seen many Baofeng ads on Amazon and e-Bay (and at various hamfests) that market UV-5R's and UV-82's as "ham radios", but I've also seen loads of street sellers (usually at weekend events) program them with FRS/GMRS channels and then market the same radios as higher power "FRS/GMRS" radios.

On Mon, Jun 8, 2015 at 3:07 PM, Jim Unroe rock.unroe@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

The Yaesu is a ham radio and is configured as such. Most "Chinese" radios are not sold as ham radios, they are just popular with hams because of their low cost and because in the USA they are only legal on the ham bands.

I guess you have never been to Texas (or a number of other conservative states)... ;-)

Oh hell no, never been out of Oz unfortunately, and with no job for five years and having just had a triple bypass, not likely to anytime soon. (You can drive to other countries, I can't lol, I envy that.) I'm also aware of the recent 'open carry' laws in Texas. Don't get me wrong, that doesn't bother me. I like guns myself, I did some time in the Army Reserve, and I'm a country boy, I can hit the side of a barn (from about a mile). But our Constitution has no 2nd Amendment (in fact it has no Bill of Rights at all) so the govt can make any law it likes in regards to firearms (and just about anything else – and they do.) and we have no options other than trying to vote the pricks, out, but they get replaced by similar pricks no matter what you do.

Don't start me on Freedom of Association – they are passing laws that prevent bikies (bikers to you) associating with other bikies – if we had a bill of rights it would be illegal.

On this occasion I was just illustrating my point about the frequency allocations.

Cheers

Geoff

Jobcom is simply one brand. The "color dot" system was developed by manufacturers selling radios to users too ignorant to be able to keep track of what frequency they bought radios for (and too illiterate to look on their license, if they had one). These radios normally came programmed for itinerant frequencies in the business/industrial pool (where coordination is not required and enforcement is spotty at best). Some brands (including most Jobcom radios) came with only one or two factory programmed channels. Other radios could be programmed by the dealer, or in some cases by changing dip switch settings on the circuit board usually hidden behind a cardstock shield behind the battery)

Two of the itinerant frequencies were taken away from the Business/Industrial pool and were combined with three new splinter frequencies to give the five channels allocated to MURS. This moved those two frequencies from Part 90 to Part 95, but a provision was included in the rules to allow anyone who held a Part 90 license on either or both of those frequencies to continue to use that license (and their Part 90 radios).

Years ago, I had a paper catalog from Grainger, which was maybe four inches thick. I remember they had Jobcom handi talkies, with color dots and the freq listed. Some how I thought I remembered UHF jobcoms. Of coure, that's a long time ago, and memory can fade.

Now, they are VHF, and maybe that's what is important?

Greg,

I agree that limiting Chirp is not the solution to the problem of illegal operation, but I do want to ask something.

Could you tell us what country you are in? The one that has this "emergency situation exemption"?

Certainly it is NOT the United States (despite the enormous number of licensed ham radio operators who mistakenly think 97.403 and 97.405 are some magical Get-Out-Of-Jail-Free card).

In case you are in the United States and are one of the misguided souls who think 97.403 and 97.405 allow you to do anything you want simply by saying it is an "emergency" allow me to point out that Part 97 applies ONLY to the Amateur Radio Service. It does NOT apply to any other radio service. If you choose to transmit in another radio service, you are NOT covered by Part 97, but you are covered by the rules applicable to the radio service where you are transmitting.

While some services have their own specific emergency rules, all non-amateur radio services used for two-way communication are covered by the general rule at Section 2.405 which says in part:

The licensee of any station (except amateur, standard broadcast, FM broadcast, noncommercial educational FM broadcast, or television broadcast) may, during a period of emergency in which normal communication facilities are disrupted as a result of hurricane, flood, earthquake, or similar disaster, utilize such station for emergency communication service in communicating in a manner other than that specified in the instrument of authorization: Provided:

. . .

(d) That in no event shall any station engage in emergency transmission on frequencies other than, or with power in excess of, that specified in the instrument of authorization or as otherwise expressly provided by the Commission, or by law.

GMRS stations are covered by section 2.405 and also by 95.143:

§ 95.143 Managing a GMRS system in an emergency.

(a) The stations in a GMRS system must cease transmitting when the station operator of any station on the same channel is communicating an emergency message (concerning the immediate protection of property or the safety of someone's life).

(b) If necessary to communicate an emergency message from a station in a GMRS system, the licensee may permit:

(1) Anyone to be the station operator (see § 95.179); and

(2) The station operator to communicate the emergency message to any radio station.

FRS and MURS stations are covered only by 2.405 because there is no special rule for FRS or MURS in an emergency.

CB stations are covered by 2.405 and also by 95.418 (CB Rule 18):

§ 95.418 (CB Rule 18) How do I use my CB station in an emergency or to assist a traveler?

(a) You must at all times and on all channels, give priority to emergency communications.

(b) When you are directly participating in emergency communications, you do not have to comply with the rule about length of transmissions (CB Rule 16, § 95.416). You must obey all other rules.

(c) You may use your CB station for communications necessary to assist a traveler to reach a destination or to receive necessary services. When you are using your CB station to assist a traveler, you do not have to obey the rule about length of transmissions (CB Rule 16, § 95.416). You must obey all other rules.

(d) You may use your CB station to transmit one-way communications concerning highway conditions to assist travelers.

Business Industrial and Public Safety stations licensed under Part 90 are covered by 2.405 and also by 90.407:

§90.407 Emergency communications.

The licensee of any station authorized under this part may, during a period of emergency in which the normal communication facilities are disrupted as a result of hurricane, flood, earthquake or similar disaster, utilize such station for emergency communications in a manner other than that specified in the station authorization or in the rules and regulations governing the operation of such stations. The Commission may at any time order the discontinuance of such special use of the authorized facilities.

You will notice a common characteristic of all these "emergency" rules -- none of them allow unlicensed operation, none of them allow transmitting on any frequency for which the operator is not licensed, and none of them allow transmitting with excess power or unapproved equipment, and all of them apply ONLY when normal means of communication are unavailable.

Well, let me toss this idea into this "can of worms ".
In a disaster, or S&R situation, it might be useful to monitor all forms of radio communication, including FRS. Doesn't mean one has to transmit, although it would be allowable under the emergency situation exemption. Why limit the ability to program in and monitor. A lot of unlicensed fools do stupid things on motorcycles, but we haven 't banned motorcycles. (Yet).
CHIRP is a tool, not an enforcer.
YMMD. :)

You said...

"...although it would be allowable under the emergency situation exemption."

There is nothing in any part of the federal regulations that says an amateur radio operator can transmit outside of the ham bands, even in an emergency (except on 2 specific frequencies in Alaska). In other words, there is no "emergency situation exemption".

What the Part 97 rules (97.401, 403, 405) (which apply ONLY to amateur radio communications) do say is that you can operate outside of your license privileges in an emergency. In other words, for example, a Tech could do phone in the Extra part of the spectrum. Part 90 rules (90.407) covers Part 90 emergency communications.

There are specific rules in each Part of the regulations, which apply to those parts. You can't apply a Part 90 statement to Part 97, and you can't apply a Part 97 statement to Part 90. Also read Part 2, which clearly excludes amateur radio from many emergency operation situations (2.405).

I can send you complete details off-line or anybody else that may want the source and cost info. Contact me off off-line if you are interested.

A couple people tried suggesting the UV-5R as a repeater but that's not really a good solution for this due to weight.

Fishing line for tether…prepared to use up to 3 to control lateral motion if it's too windy. Still working on line retrieval solution.

Balloon: http://www.highaltitudescience.com/collections/near-space-balloons/products/near-space-balloon-350-g

Water proof bag, external battery and spare and charger, ground stakes, caribiners,

Total cost for complete solution and one flight is about $700 including $130 for helium from Hobby Lobby. Still working on getting helium through our county account as the helium shortage is preventing new accounts from being created. Hydrogen is an undesirable solution due to static electricity possibilities.

I'm getting ready to test a balloon cross band using a Wouxun KV-UV8D for search and rescue purposes. You can go to 500ft on a tethered balloon without FAA approval.

I'm going to put a Harvest RH-660S antenna which is a ½ wave on VHF and 5/8 on UHF.

I'm doing this as we had a rescue last year in a hilly area where the repeater we put up at 50ft wasn't high enough and the terrain mapping I've done shows 500ft should be able to get everywhere we need to go.

Now that's an interesting and fun project ... some questions, please?

Will you be using the 500g latex, and what's your source for meteorological balloons?

What tethering line will you be using to minimize weight, and hence attainable elevation?

... and I'm sure you've already considered the FAA 500' minimum terrain elevation wrt tethering in hilly country. Some cowboy yayhoo pilots like to keep that planetary separation over flat land where people are watching, and then ignore it to give the passengers a thrill over some hilly country, and some news-crew helicopter-drivers think

the rules don't apply to them in "the wilds". One would certainly want to make any such tethered device as visible as possible, perhaps by using long red/silver foil strips available from orchard supply shops.

Your project inspires me in terms of county ARES/RACES capability enhancement, thank you.

All the other radio services (MURS, GMRS, FRS, CB and usually Part 90, before the Baofengs and Wouxuns) equipment is incapable of adding freqs not preprogrammed into them or changing power levels, etc, thus there was no need for the provisions found in Part 97, where the equipment offers greater versatility, theoretically due to the extra knowledge ham radio operators are 'supposed' to have.

Thank you for the look into radio service in Aus.

I've noticed that posts recently have a lot of trailing
text. This one, for example, had ten old, trailing
messages. Count them below... ten.....

Please take a moment and delete some old text.

I thought you sounded familiar Chris. I was in a list where you were owner/moderator.

I’ll try to remember to do that.

Thank you for the look into radio service in Aus.

I've noticed that posts recently have a lot of trailing
text. This one, for example, had ten old, trailing
messages. Count them below... ten.....

Please take a moment and delete some old text.

I’m pretty sure this has been mentioned on here before.

Pilots and Marine radio operators are taught, as are Air Traffic Services, that if you are in distress (specifically there is ‘grave and imminent danger’ to life and you ‘require immediate assistance’) you may use ‘any means’ to obtain assistance. I hold or have held all those comms qualifications.

Quote: “You may use any channel or any means at your disposal to obtain assistance if you are in distress.”

Sometimes, in some manuals it’s a little vague but, from the Australian Marine Radio manual specifically:

“128.3 If no answer is received on distress frequencies, the message should be repeated on any other available frequency where attention might be attracted.”

“Any other available frequency” means exactly that.

This is specifically stated in the SOLAS convention and is in any Marine Radio manual in some form and it’s also in the ICAO regs somewhere.

The test is whether there was, indeed, a ‘distress’ situation and whether there were other means available or not. However, as a specific example, if you are on a boat with an illegal Baofeng and the boat catches fire and it’s radio is destroyed, and you are going to abandon and are in’ grave and imminent danger’ of, say, being eaten by the sharks circling the boat, or your lifejacket got burnt in the fire or whatever... then yes, you can legally use it ON ANY CHANNEL specifically for the purpose of obtaining assistance as that is clearly a distress situation. Use of the proword, MAYDAY would immediately indicate a distress message follows and provided it was genuine, no one will prosecute you for using that means to obtain assistance.

In this instance it doesn’t matter if you have a ham license, a marine radio license, a pilot’s radio certificate or no license of any kind, you may use that means, if you have no other, to call for rescue to save your life and/or that of others with you.

I’m not aware of any country where this provision doesn’t apply if they are signatories to the SOLAS and ICAO conventions.

More general ‘emergency’ situations are not covered. So someone with a twisted ankle on a hiking trip may well not be covered, unless they are in ‘grave and imminent danger’ so it’s not a general exemption where you get to judge the level of ‘emergency’ – there must be specific danger to life and it must be ‘grave and imminent’. My Mum will kill me if I don’t get home before dark, would not be ‘grave and imminent’ danger in the opinion of most people, if it’s 48c in the waterbag and you have no water and are stuck on the side of a mountain after a plane crash however, it clearly would be.

Subject: [baofeng_uv5r] Need to buy a spare for my two year old UV-5R

I'd like to buy another cheap Baofeng, but avoid as many issues as possible.

Main Trading Co. promises that all in stock radios have the latest firmware. But after reading about recent issues, is that a good thing?

Do any of the cheap models come with the A-V85 antenna?

Since I'll only use one radio at a time, I see no reason to buy another upgrade antenna (have a NA-711).

Any benefit of the UV-82 over the UV-5R?

I have several spare batteries for the 5R. Batteries for the 82 are about twice as much.

Leaning toward Amazon again (SBA) to save shipping.

are now on their way, should get em by middle of next week.
So now am gonna have a coffee.. have a read up on the Miklor website, and have a look around to see what I can read up on to get started in Amateur Radio. May even give the local radio club a call, or fire off an email ?? Will See.

Best Regards
Wayne

As they say - "reasonable men may differ". In the FCC's FAQ section (FCC.gov) there is language that clearly states that Sec. 97.403 is an exception... to the "Rules". My interpretation is that this means what it says, and that "Rules" in this context refers to Part 97 as a whole. The section also states (as you are aware) "any means of radio communication at its disposal". It does not limit this phrase in any way.

I think that you, and perhaps others, have misinterpreted what I have said. CHIRP allows the programming of FRS frequencies. That allows a person to scan them and, in an emergency, act.

I have enjoyed your posts, and you make some good points. It would be appreciated, however, if you would refrain from the perjorative characterization of comments with which you don't agree. Those comments do little to move the conversation forward.

Thank you

It would be, except so many people insist on using those freqs on these radios, which is illegal any way you wish to look at it. If the topic would not come up anymore, we wouldn't have this conversation at all. Jardy Dawson

  is it reasonable to take frs/gmrs/murs elsewhere rather than the baofeng forum

On Wed, Jun 10, 2015 at 1:48 PM, Greg lewiswriter@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

  As they say - "reasonable men may differ". In the FCC's FAQ section (FCC.gov) there is language that clearly states that Sec. 97.403 is an exception... to the "Rules". My interpretation is that this means what it says, and that "Rules" in this context refers to Part 97 as a whole. The section also states (as you are aware) "any means of radio communication at its disposal". It does not limit this phrase in any way.
I think that you, and perhaps others, have misinterpreted what I have said. CHIRP allows the programming of FRS frequencies. That allows a person to scan them and, in an emergency, act.
I have enjoyed your posts, and you make some good points. It would be appreciated, however, if you would refrain from the perjorative characterization of comments with which you don't agree. Those comments do little to move the conversation forward.
Thank you

  Greg, I agree that limiting Chirp is not the solution to the problem of illegal operation, but I do want to ask something. Could you tell us what country you are in? The one that has this "emergency situation exemption"? Certainly it is NOT the United States (despite the enormous number of licensed ham radio operators who mistakenly think 97.403 and 97.405 are some magical Get-Out-Of-Jail-Free card). In case you are in the United States and are one of the misguided souls who think 97.403 and 97.405 allow you to do anything you want simply by saying it is an "emergency" allow me to point out that Part 97 applies ONLY to the Amateur Radio Service. It does NOT apply to any other radio service. If you choose to transmit in another radio service, you are NOT covered by Part 97, but you are covered by the rules applicable to the radio service where you are transmitting. While some services have their own specific emergency rules, all non-amateur radio services used for two-way communication are covered by the general rule at Section 2.405 which says in part:The licensee of any station (except amateur, standard broadcast, FM broadcast,

noncommercial educational FM broadcast, or television broadcast) may, during a period of emergency in which normal communication facilities are disrupted as a result of hurricane, flood, earthquake, or similar disaster, utilize such station for emergency communication service in communicating in a manner other than that specified in the instrument of authorization: Provided:. . .(d) That in no event shall any station engage in emergency transmission on frequencies other than, or with power in excess of, that specified in the instrument of authorization or as otherwise expressly provided by the Commission, or by law. GMRS stations are covered by section 2.405 and also by 95.143:§ 95.143 Managing a GMRS system in an emergency. (a) The stations in a GMRS system must cease transmitting when the station operator of any station on the same channel is communicating an emergency message (concerning the immediate protection of property or the safety of someone's life). (b) If necessary to communicate an emergency message from a station in a GMRS system, the licensee may permit: (1) Anyone to be the station operator (see § 95.179); and (2) The station operator to communicate the emergency message to any radio station. FRS and MURS stations are covered only by 2.405 because there is no special rule for FRS or MURS in an emergency. CB stations are covered by 2.405 and also by 95.418 (CB Rule 18):§ 95.418 (CB Rule 18) How do I use my CB station in an emergency or to assist a traveler? (a) You must at all times and on all channels, give priority to emergency communications. (b) When you are directly participating in emergency communications, you do not have to comply with the rule about length of transmissions (CB Rule 16, § 95.416). You must obey all other rules. (c) You may use your CB station for communications necessary to assist a traveler to reach a destination or to receive necessary services. When you are using your CB station to assist a traveler, you do not have to obey the rule about length of transmissions (CB Rule 16, § 95.416). You must obey all other rules. (d) You may use your CB station to transmit one-way communications concerning highway conditions to assist travelers.
Business Industrial and Public Safety stations licensed under Part 90 are covered by 2.405 and also by 90.407:§90.407 Emergency communications.The licensee of any station authorized under this part may, during a period of emergency in which the normal communication facilities are disrupted as a result of hurricane, flood, earthquake or similar disaster, utilize such station for emergency communications in a manner other than that specified in the station authorization or in the rules and regulations governing the operation of such stations. The Commission may at any time order the discontinuance of such special use of the authorized facilities. You will notice a common characteristic of all these "emergency" rules -- none of them allow unlicensed operation, none of them allow transmitting on any frequency for which the operator is not licensed, and none of them allow transmitting with excess power or unapproved equipment, and all of them apply ONLY when normal means of communication are unavailable. From: Michael D Earls
Topic: 50724 Message: 50790

It was still showing at https://baofengtech.com/purchase last night, but the link brought up the regular price at Amazon.

Today, their site no longer shows the special price.

I'm now following them on FB.

BaofengTech informed me they run the special every few months.

Have to decide if the extra power is worth it.

To me they are worth it. I bought 2 at the regular price. I have been driving and when the UV5R DROPPED out of the repeater I dove on for a bit just to be sure it wasn't terrain and switched to the BF-F8hp And got a full quieting report. I keep hearing the whine aboutit's only 1db gain and all the other put downs but in my practical expearance, they are worth it!

The radio allows programming FRS frequencies. Not CHIRP. CHIRP cannot program any frequencies in these radios that can't be programmed into the radio using the keypad.

I realize that. CHIRP just makes it easy to insert the freqs. If people had to research this info, maybe they might learn something? Nah!!! What am I thinking?

If you're like most of us Wayne, you have just taken the first step down an interest path that you will be on for the rest of your life. I encourage you to embrace it with both arms and while enjoying making and maintaining new friends on the bands, delve into the theory, not just to the point required to get your licence, and also get your hands dirty on the bench, building, designing and modifying circuits etc. That way you will maximise the benefits the hobby will bring you.

Bill, VK1MX & VK7MX

I realize that. CHIRP just makes it easy to insert the freqs. If people had to research this info, maybe they might learn something? Nah!!! What am I thinking?

The radio allows programming FRS frequencies. Not CHIRP. CHIRP cannot program any frequencies in these radios that can't be programmed into the radio using the keypad.

Someone brought these dotted radios to our tables to try to pawn them at one of our shows. They had Green dots on some and blue on the other made by Radio Shack Realistic.

They were brick sized and most likely early 90’s technology.

Subject: Re: [baofeng_uv5r] MURS freqs USA

Jobcom is simply one brand. The "color dot" system was developed by manufacturers selling radios to users too ignorant to be able to keep track of what frequency they bought radios for (and too illiterate to look on their license, if they had one). These radios normally came programmed for itinerant frequencies in the business/industrial pool (where coordination is not required and enforcement is spotty at best). Some brands (including most Jobcom radios) came with only one or two factory programmed channels. Other radios could be programmed by the dealer, or in some cases by changing dip switch settings on the circuit board usually hidden behind a cardstock shield behind the battery)

Two of the itinerant frequencies were taken away from the Business/Industrial pool and were combined with three new splinter frequencies to give the five channels allocated to MURS. This moved those two frequencies from Part 90 to Part 95, but a provision was included in the rules to allow anyone who held a Part 90 license on either or both of those frequencies to continue to use that license (and their Part 90 radios).

Years ago, I had a paper catalog from Grainger, which was maybe four inches thick. I remember they had Jobcom handi talkies, with color dots and the freq listed. Some how I thought I remembered UHF jobcoms. Of coure, that's a long time ago, and memory can fade.

Now, they are VHF, and maybe that's what is important?

I would bet that most of the older "color dot" radios that were sold in big box stores, office supply stores, etc., a few years ago are not narrow band capable, and are therefore no longer permitted for use (in the United States).

If the "dot" color scheme you are referring to is the VHF MURS colored dots, 2 of the 5 channels are wide-band (and thus still perfectly usable within the U.S.), the other 3 channels are narrow-band.

Mike,

If more power is your thing, you may also want to look at the new TYT TH-UV8000D, which not only has 10 watts on both VHF and UHF, but comes with a 3600 mAh battery, two antennas (one being about 15.5" long), 256 memory channels (vs. 128 in the Baofeng), and the ability to name your memories from the keypad, plus unlike the BH-F8HP, the TYT has Part 90 approval.

There were a number of VHF and UHF "color dot" frequencies. Two of them I think are now MURS. Without looking it up, I don't know if they are the two wide band channels, but they could be. All of the other former color dot channels are now narrow only.

Hello all,

I've been listening and feel I should make a different point of view. When programming local police frequencies it's already known to not transmit on that frequency. In chirp you can set it to not transmit; only monitor. The same can be done with frs/gmrs frequencies. The problem is not having the frequency in the radio. It's, the irresponsible operators. The same as a firearm; a lot of irresponsible (owners) uses them for the wrong reasons. I personally have frs/gmrs programmed into my radios including my Kenwood. However, I only monitor. If ever anyone called out for an emergency I would here it and report it accordingly (thinking outside the box). Just like the firearm. Some should not be used except in an emergency not used just because you it.
Hope this helps.

Jesse

Oh yes, the extra 3W on VHF and 2W on UFH is definitely worth the extra expense. Trying to get into one of my favorite 2m repeaters from 24 miles away with a Diamond RH77CA attached via BNC-to-SMA/F adapter, I was unable to transmit a copyable signal at 5W, but was able to at 8W, and at nearly full-quieting. The BF-F8HP radios are awesome, especially if you replace the stock antenna with a better one.

Not really hung up on the power. The higher cost and lack of accessories for the UV-8000D, especially spare batteries are big negatives for me.

If I opted for the F8-HP, the batteries and speaker mic would interchange with the 5R.

Still, would rather avoid the higher cost of the F8-HP.

Front runner is still the $27 UV-5R.

For my needs, 128 channels and 4 watts have been adequate.

I recalled reading about several issues with recent firmware in some models. It was really avoiding buying one of those problems that prompted my post.

My current 5R is having issues with the volume knob and speaker/mic port. Bought some plastic safe contact cleaner, but won't disassemble until I have a replacement programmed.

Mike,
If more power is your thing, you may also want to look at the new TYT TH-UV8000D, which not only has 10 watts on both VHF and UHF, but comes with a 3600 mAh battery, two antennas (one being about 15.5" long), 256 memory channels (vs. 128 in the Baofeng), and the ability to name your memories from the keypad, plus unlike the BH-F8HP, the TYT has Part 90 approval.

The MURS freqs has 3 wide and 2 medium bandwidths (I think). Those have not and will not change. Only Part 90 business and public safety had to switch to narrow. Marine band also did not change, even though in same freq range.

I spend most of my time in a recliner to keep my legs elevated. The more time I spend in my wheelchair at my desk where my 8800 and IC-746 are, my swelling gets progressively worse.

It's much more convenient to use my UV-5R 'mini base station'. The recliner has a fold up table on each side containing a cup holder. I cut down a 20oz Coke bottle to form a shell that holds the radio in the cup holder.

Since it's stationary, I have it connected to an N9TAX slim jim hanging from the ceiling. I cycle three standard batteries for power.

If I'm going to be outside, I install the NA-771 and use it on 1 watt to crossband thru the 8800.

My love for gadgetry makes the F8-HP tempting, even at $62.89. But in all honesty, the 5R does everything I need,

Oh yes, the extra 3W on VHF and 2W on UFH is definitely worth the extra expense. Trying to get into one of my favorite 2m repeaters from 24 miles away with a Diamond RH77CA attached via BNC-to-SMA/F adapter, I was unable to transmit a copyable signal at 5W, but was able to at 8W, and at nearly full-quieting. The BF-F8HP radios are awesome, especially if you replace the stock antenna with a better one.

Close Jardy....

§95.632 MURS transmitter frequencies.
(a) The MURS transmitter channel frequencies are 151.820 MHz, 151.880 MHz, 151.940 MHz, 154.570 MHz, 154.600 MHz.

(b) The authorized bandwidth is 11.25 kHz on frequencies 151.820 MHz, 151.880 MHz and 151.940 MHz. The authorized bandwidth is 20.0 kHz on frequencies 154.570 and 154.600 MHz.

(c) MURS transmitters must maintain a frequency stability of 5.0 ppm, or 2.0 ppm if designed to operate with a 6.25 kHz bandwidth.

[65 FR 60877, Oct. 13, 2000, as amended at 67 FR 63289, Oct. 11, 2002]

As I understand it, Marine will not change for some time, if ever, as it’s to some degree a global standard – the US has some minor variations to it and many countries are a long way from wanting or even needing narrowband.

Thanks for checking. Notice the spacing. Normal narrow band is 12.5, wide 25, not 11.25 and 20. Using a Boafeng or any other 'standard' radio with a normal MURS will sound a little bit off. Not sure by how much, though.

> I've been listening and feel I should make a different point of view. When programming local police frequencies it's already known to not transmit on that frequency. In chirp you can set it to not transmit; only monitor. The same can be done with frs/gmrs frequencies. The problem is not having the frequency in the radio. It's, the irresponsible operators. The same as a firearm; a lot of irresponsible (owners) uses them for the wrong reasons. I personally have frs/gmrs programmed into my radios including my Kenwood. However, I only monitor. If ever anyone called out for an emergency I would here it and report it accordingly (thinking outside the box). Just like the firearm. Some should not be used except in an emergency not used just because you it.

Ya it took them a few days to remove the sale price from THEIR site, but if you clicked on the link, it would take you to the radio on Amazon (their only seller) where the price was the regular one. I was puzzled at first too.

---In baofeng_uv5r@yahoogroups.com, <mikeearls@...> wrote :

It was still showing at https://baofengtech.com/purchase https://baofengtech.com/purchase last night, but the link brought up the regular price at Amazon.

Today, their site no longer shows the special price.

I'm now following them on FB.

BaofengTech informed me they run the special every few months.

Have to decide if the extra power is worth it.

I just got the mobilnkd TNC(2) APRS interface seen in last month's QST magazine. (bluetooth paired to android phone running APRSDroid app cabled to mic port on radio). I am outside the range of the nearest digipeater with the standard antenna. I found that better antenna gain equaled better receive (by the digipeater) data. I tried it with both a UV3R+ (2 watt TX) and a BFF8+ (4 watt VHF) and with the exact same antenna received packets were identical. Double the power made no difference. But that is packet data, not voice. Just found that interesting that in THIS application power difference did not result in received packet quality difference.

BTW if you are interested, I highly recommend this as an APRS option (requires a dedicated radio) especially compared to the Easy-Digi TNC interface.

---In baofeng_uv5r@yahoogroups.com, <mikeearls@...> wrote :

Not really hung up on the power. The higher cost and lack of accessories for the UV-8000D, especially spare batteries are big negatives for me.

If I opted for the F8-HP, the batteries and speaker mic would interchange with the 5R.

Still, would rather avoid the higher cost of the F8-HP.

Front runner is still the $27 UV-5R.

For my needs, 128 channels and 4 watts have been adequate.

I recalled reading about several issues with recent firmware in some models. It was really avoiding buying one of those problems that prompted my post.

My current 5R is having issues with the volume knob and speaker/mic port. Bought some plastic safe contact cleaner, but won't disassemble until I have a replacement programmed.

Mike,

If more power is your thing, you may also want to look at the new TYT TH-UV8000D, which not only has 10 watts on both VHF and UHF, but comes with a 3600 mAh battery, two antennas (one being about 15.5" long), 256 memory channels (vs. 128 in the Baofeng), and the ability to name your memories from the keypad, plus unlike the BH-F8HP, the TYT has Part 90 approval.

Hi Mike

"Have to decide if the extra power is worth it."

I say it is better to have it and not need it, vs. need it and not have it.

I had mine tested at the ARRL Labs and with the BL-5 battery it measured more than 8w.

I do not see why one will buy the UV-5R when the BF-F8 HP is out there. I am converting all my UV-5Rs to BF-F8 HPs.

For some reason I can transmit on the external mike but, when you try and Push to talk on the radio nothing happens. Is there some thing you can change to fix that?

They have released an UV5R tri-power version that does do 8W. I got 5 of them in for test they are generically marked in front as a uv5R. The BF F8 HP Chirp program is the same one to use.

On the back label it states 8W

UHF is lower but I measured 8W on VHF

Between the new tri-power UV-5R, the FCC Part 90 certified BF-F9V2+ tri-power, and the new FCC Part 90 certified TYT 10 watt UV-8000D, that may help explain why Baofeng Tech is starting to have sales on their BF-F8HP units.

You can SOMETIMES shorten the delay in receiving, but how depends on what you are doing that makes the delay long in the first place.

If you are scanning, stop scanning because the radio cannot receive a signal until it comes to that channel.

If you are in dual watch, realize that "dual watch" is NOT dual receive but just scanning back and forth between the two channels - then see "If you are scanning" above.

If you have a Receive (Rx) Tone or DCS Code enabled, turn off this feature which silences the receiver until the radio decodes the tone or the code. (Note that Receive Tone or Receive DCS codes are NEVER NEEDED to hear any signal)

If you are NOT Scanning, NOT in Dual Watch, and NOT using a Receive tone or code, then the radio is receiving as quickly as it is capable of doing - which would only make you miss "the first few words" if the person talking to you is speaking at about a hundred words per minute or faster.

James no links as I got them from AnySec but can send you a picture of one later when I setup in Vegas. I measured the power too to see what they were. They were the first tri-bands I found that were not sold via BT or Foscom or other big importer. The sales people at AnySec mentioned they were a batch going to Poland and if I wanted a few.

Generally uv5R marked radios are a hard sell for us as most want them less than what we paid for them, but I wanted to test them but was skeptical at first. So I took a chance and got the 5 they had.

Contact me off list if you want more info (UHF was not 8W though) VHF was 8W UHF 6w+ on the ones I tested.

Firmware was a version that was new so sent the factory image to Jim

Some also are sticky at first a split second delay when the PTT is pushed. This goes away after use, I have seen a few this way. Also some repeaters drop the first bit off to keep off noise sources from firing the repeater. Maybe this is what is going on?

So no... the UV-5RTP is not the same as the BF-F8HP (can't speak to the specs of the BF-F9TP).

I have both the 5RTP and the F8HP, and I can tell you that they are different radios when it comes to usage. The 5RTP gets a little hotter faster than the F8HP, the F8HP weighs a little more than the 5RTP, and the transmit audio of the F8HP is a LOT better than the 5RTP. On a fully charged battery (8.3volts give or take 0.1volt) the output of the F8HP (at least mine) is a full 8.3 watts. The 5RTP puts out 7.4 watts. Also, I find the audio output of the F8HP is a little cleaner than my 5RTP.

5RTP

I have to say, that I haven't bench tested these radios, and yes they use the same BF-F8HP template in CHIRP, but when using them, I can tell the difference in the two.

I personally like the BF-F8HP a little better than the 5RTP. The main thing is the heat. I really like to rag chew in the mornings, and I don't like my radio heating up.

Hi

I do have a UV-5RTP from Aliexpress for 44 USD shipped.

I like it.

It looks identical to the BF-F8+ with a non inverted display.

Bad things compared to BF-F8HP:

Came with the "old" UV-5R crap antenna

Came with the default UV-5R battery.

The last point is propably also responsible for the weight difference.

Please keep in mind when measuring that there are unit2unit differences.

Eg one BF-F8HP can output 8.1W the other maybe just 7.8W.

I would be very surprised if the internals (except battery and antenna) are different between the BF-F8HP and the UV-5RTP.

So no... the UV-5RTP is not the same as the BF-F8HP (can't speak to the specs of the BF-F9TP).

I have both the 5RTP and the F8HP, and I can tell you that they are different radios when it comes to usage. The 5RTP gets a little hotter faster than the F8HP, the F8HP weighs a little more than the 5RTP, and the transmit audio of the F8HP is a LOT better than the 5RTP. On a fully charged battery (8.3volts give or take 0.1volt) the output of the F8HP (at least mine) is a full 8.3 watts. The 5RTP puts out 7.4 watts. Also, I find the audio output of the F8HP is a little cleaner than my 5RTP.

Geoff, saw your comment about going from Aus to Alaska. During WW2 the German tanks in South Africa were using 27 MC (MegaCycles) to talk tank to tank. My father used to tell me that there was one particular hill in Rhode Island where they could hear the tanks at their monitoring station. Downside was that every couple of weeks the power company would have to relocate the poles the long wire antenna was on.

The 2 things that I would add to Xaun's list would be...

Set menu 3 (SAVE) to OFF (or at least to a lower value). The battery save feature puts the radio to "sleep" for a few cycles then "wakes" up for a few cycles to see if there is any activity. Then the process is repeated. The value of this setting varies the radio of sleep cycles to awake cycles. The higher the number the longer the radio sleeps between awake cycles. Like scanning, the radio can't receive until it wakes up so the first syllables of a transmission can be lost while the radio is sleeping.

Set menu 35 (STE), menu 36 (RP-STE) and menu 37 (RPT-RL) to OFF. When these menus are enabled, the transition form TX to RX is delayed to accommodate the Squelch Tail Elimination process.

Well, in the mid 70’s even from mobile installations, it was not at all uncommon to hear US stations. Couldn’t always work ‘em, some were probably using linears or something other than a CB, but now and they you’d get through, though it was more common get ‘in country’ skip. The Alaskan station used a callsign of ‘North Slope Sidebander’ and was on Ch16 LSB if I remember rightly. I was using a Super Bengal into a half wave ringo at the top of a 35ft former TV tower (we were in a TV fringe area). As to German Tanks, the 10 W.S. and 20 W.S. tank radios did operate on 27.2 to 33.3Mhz so if conditions were right, I can’t see why that wouldn’t be possible.

Thanks for that.

Regards

Geoff

I guess I should have specified.....

BF-F8HP radio body WITHOUT battery, WITHOUT antenna, and WITHOUT beltclip (including the screws) was 119 grams.

UV-5RTP radio body WITHOUT battery, WITHOUT antenna, and WITHOUT beltclip (including the screws) was 112 grams.

I guess I could have weighed the BF-F8HP with the Nagoya 771, extended battery, leather case, and speaker mic, then compared it to the UV-5RTP with stock antenna, standard battery, and naked case, but I tried to keep them as same as possible.

I am inclined to wait until we know if they have introduced any new quirks. Price wise on Amazon at least there is less than $10 difference between the UV5RTP and the BFF8HP. Sainsonic/Sanatop seems to be the importer on Amazon.

Another thing to look at is the power save setting... check it out at Miklor's site.

It works by letting the radio go into a standby mode and taking repeated looks, snap-shots, of the channel. If the incoming signal just happens to catch the radio sleeping, you'll miss the first little bit of the message.

Stan

Is there any way to shorten the time the radio will receive? When somebody keys the mike I often miss the first few words because the radio takes too long to receive.

This email has been checked for viruses by Avast antivirus software.

And, in general, everyone should develop the habit of push - PAUSE - talk. Most people tend to start talking at the same time they push the PTT button. Push the button, pause for a second, then talk. Of course, this won't help you hearing the first part of others transmissions, but maybe it will help others realize the benefit of doing so, and get the habit to spread.

hi all,

I note that when I hold down the '0' key to see my battery level, there's also a tiny digit '5' that appears on the far-left of the display. Separate from the main DC voltage readout.

Does this '5' denote anything?

I have two radios, with different charge levels, and they both display the '5', so I don't think it's related to charge level.

cheers,
calum.

Years ago, I decided to wait a full second before reply. In case
some other station wants to transmit and ask a question,
change the subject, etc. Some folks are fine with this, but now
and again (back in my CB days) would get someone who
releases the TX, doesn't hear me, and keps transmitting
again and again, to ask where I am. Won't allow even one
second of dead air time.

Agree, it's good to push the TX button and wait half second
before speaking. Good idea.

John these were labeled Uv5R with generic stickers nothing extra which prompted me to check the power output.

They programmed with the f8 HP program. I will post a picture of the front and back when I dig them out of crates tomorrow

Looked exactly the same as a generic uv5R except the back sticker was marked 8W

Many hams also do that on the HF bands.
As soon as one guy stops talking,,,the other ham gets his MIC keyed up on the last word.
And what about those hams on 2 meters that listen to me and a couple others,never breaks in no matter how long we unkey and even ask if any one wants to use the repeater and we usually waited for 10 seconds then asked a second time.
Then you have the ham that calls the repeater owner and grips about a few guys hogging up the repeater.
But the repeater owner told him he heard us many times asking if any one wants to use the repeater so if your not going to jump in then shut your scanner off.
We now tell the hams and they never come back or they do it as should be.

Hi

Interesting.

Anybody opened up their devices, and taken a look what the actual difference betweem the BF-F8HP and the UV-5RTP?

My UV-5RTP came with a very recent Firmware (which has the non binary S-Meter).

Regarding the other message regarding bat voltage.

For me it does not display any additional digit.

It just does not clear the channel number.

So maybe it is that what you see?!?

thanks, but no: the channel number is shown on the right; this number
'5' is on the far left.

It is shown when checking battery in both channel, and frequency modes,
and is also independent of which channel is currently set.

here's a pic:

https://drive.google.com/file/d/1AUE3q6EdHejz-scm4jIndEnmYexb39yQuw/view?usp=sharing

hopefully, you can just see the small '5' at the far-left (in shadow).

perhaps it's just a spurious display glitch...

cheers,
calum.

I would suspect that the frequency that is programmed into channel 5
has a 2 and a 5 in the 4th and 5th place after the decimal point.

For example FRS channel 1 (462.56250) would show "5" after the "V" for
volts. Tune to a channel that the (resolution doesn't go down to 4 or
5 places after the decimal point (that is nnn.nnn like 162.450 for the
NOAA weather radio or 146.520 for the 2 meter ham simplex call
channel) and see if there is anything additional displayed.

And this is apparently a bug in your particular firmware because the
radio I am testing this with correctly turns of the 4th and 5th place
digits past the decimal when the voltage is displayed.

The small 5 on the right side of the display is part of the 2T5T icon (two-tone & five-tone paging).

If you set the power on display mode to FULL you should see it along with other unused icons.

Hi freeglerabzwayne,

Thanks for the reply, I totally agree, the UV-5R is as you say cheap and cheerful, but that only encourages me to play around with it even more. The opcodes must be available otherwise the 3'rd party programs like Chirp & UV-5R VIP amongst others couldn't be written. I know that some programers try to keep it from the public domain for their own gain. However, I'll continue looking.

Best regards, Mate

Bob.

What kind of frequency counter is it?
When was the last time it was calibrated?
What is the timebase accuracy?
What is the display resolution?

It could be that your radio is off frequency or it could be that your
counter is a useless uncalibrated consumer/hobbyist grade piece of junk.

You need a high end freq counter i.e Fluke with a Cesium beam freq standard 10mhz input or a Iridium version.

Anything else will not be that accurate but high end counters should be +- 1 PPM

50879. My BF-F8HP does not transmit on 2m - help!

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-13 21:22:53 UTC
From: jt327gir@...
Topic: 50879 Message: 50879

Hey guys,

I bought my BF-F8HP a few weeks ago, and absolutely LOVE it! But I've run into a serious problem with it - it no longer transmits on 2m. I can receive on 2m, and transmit and receive on 70cm, but 2m transmit is just completely dead. I use CHIRP to program the radio, and have made sure the "VHF Tx Enabled" box is checked. I have the radio set up to transmit ONLY on 144-148 MHz and 420-450 MHz. I've tried the last menu item (Reset all), and then re-load my image, but that doesn't help.

Do I need to somehow re-load the firmware? Here is the firmware as listed in CHIRP:

Firmware Message 1: F5R3407
Firmware Message 2: F8HP-1
6+Power On Message 1: 150412N

If anyone on this forum has had any experience in fixing this particular problem with their BF-F8HP, or can offer any guidance as to how I can fix it, please, please let me know.

I also have a UV-5RA, which is excellent, and of course my Yaesu FT1-DR is wonderful as well. I just like having the option of 8W if I need it, and the radio is more aesthetically-pleasing to me than the standard UV-5R.

Thanks!

John Tibbetts,
W9APX

You say lic free job ???
does that imply you are trying to use it to transmit on HAM
frequencies ?? if so you might do better by studying radio
technology and getting a ham ticket then if you have problems someone
in your local area maybe just up the street can help you, many hams
have accurate means to measure frequency to confirm what you have
discovered

Do you get no RF output, or do you get the TX inhibited "bleep" when
the PTT button is pressed?

> I use CHIRP to program the radio, and have made sure the
> "VHF Tx Enabled" box is checked.

This setting does nothing. It is just a duplication of the setting in
the OEM software. Whether it is ticked or not has no affect on the
radio's ability to TX. This apparently was a feature that was never
implemented in the radio.

Which version of CHIRP are you using?

> I have the radio set up to transmit ONLY
> on 144-148 MHz and 420-450 MHz.

> I've tried the last menu item (Reset all),

RESET doesn't do much more than erase the memories and set the menus
to their firmware defaults. It isn't useful for "fixing" and real
problems.

> and then re-load my image, but that doesn't help.

And if RESET could fix this issue, reloading your image just changes
your radio's memory back to the way it was before you reset it,
breaking it again.

>
>
> Do I need to somehow re-load the firmware?

You can't reload the firmware. The firmware is fixed and cannot be
updated or changed.

If this is a software/memory issue, you can "fix" it by uploading the original image that you downloaded from your radio. It would set the radio's memory back to the way is was when you got it. Did you happen to save your original memory state as a backup before you started making changes?

If you didn't know to or forgot to make this backup, normally I would tell you to download a "factory" image from a collection of "factory" images found here:
http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/

Unfortunately there isn't an F5R3407 "factory" image available. I do have some F5R3407 images that aren't "factory" that you are welcome to try.

Jim,

Thanks so much for your reply!

To answer your questions:

1) I have no RF output on 2m.
2) I am using CHIRP-Daily 20150502
3) I did not make an initial backup the first time I used the radio, unfortunately.

I would love to have your image for this radio. If you could e-mail it to me at jt327gir@gmail.com, I'd be extremely grateful.

Thanks!

Ah no, the '5' on the left has nothing to do with the least-significant
frequency digits on the right. It appears even when tuned to e.g. 400.000

> And this is apparently a bug in your particular firmware because the
> radio I am testing this with correctly turns of the 4th and 5th place

Good point! Yes, I'd wondered about that.

Both my UV-5R radios get that wrong (i.e. fail turn it off): firmwares
N5R-219 & N5R2401.

cheers,
calum.

Yes.
I don't have my license, yet, but I have programmed my UV-5R to the regional frequency with no issues.
Well, except one. I you program your radio with other frequencies, and let it do a 'scan', because the radio squelch controls, when it 'hits' the weather frequency that you programmed, it will stay on that frequency. This is because it is always broadcasting.
You can move up or down on the controls, and it will start scanning again. Daniel Rodriguez drodr05@...

Just received.

The battery, although marked BL-5, is also marked 2100 mAh.

It is 4mm thicker than the 1800 mAh battery.

Hi Bob,

Yes. You can program the local NOAA weather radio frequencies. I have all 7 programmed into my radios.

Unfortunately, you cannot program a TX disabled channel without software. So the best you can do is program it like a repeater. Have the RX frequency programmed as 162.400 MHz. Then program the TX frequency to be on an unused ham frequency in your area. That way if you do accidentally transmit, it will be on a frequency that you are licensed for instead of on one that your are not.

What I would choose would be a repeater input frequency that is NOT USED IN YOUR AREA. Don't forget to program it to the LOW power level. This way nobody would ever be listening on this frequency so your chances of causing any interference would be very small.

Posted by: jt327gir Hey guys, I bought my BF-F8HP a few weeks ago, and absolutely LOVE it! But I've run into a serious problem with it - it no longer transmits on 2m. I can receive on 2m, and transmit and receive on 70cm, but 2m transmit is just completely dead. I use CHIRP to program the radio, and have made sure the "VHF Tx Enabled" box is checked. I have the radio set up to transmit ONLY on 144-148 MHz and 420-450 MHz. I've tried the last menu item (Reset all), and then re-load my image, but that doesn't help. Do I need to somehow re-load the firmware? Here is the firmware as listed in CHIRP: Firmware Message 1: F5R3407 Firmware Message 2: F8HP-1 6+Power On Message 1: 150412N If

anyone on this forum has had any experience in fixing this particular problem with their BF-F8HP, or can offer any guidance as to how I can fix it, please, please let me know. I also have a UV-5RA, which is excellent, and of course my Yaesu FT1-DR is wonderful as well. I just like having the option of 8W if I need it, and the radio is more aesthetically-pleasing to me than the standard UV-5R. Thanks! John Tibbetts, W9APX Reply to sender . Reply to group . Do you get no RF output, or do you get the TX inhibited "bleep" when the PTT button is pressed? > I use CHIRP to program the radio, and have made sure the > "VHF Tx Enabled" box is checked. This setting does nothing. It is just a duplication of the setting in the OEM software. Whether it is ticked or not has no affect on the radio's ability to TX. This apparently was a feature that was never implemented in the radio. Which version of CHIRP are you using? > I have the radio set up to transmit ONLY > on 144-148 MHz and 420-450 MHz. > I've tried the last menu item (Reset all), RESET doesn't do much more than erase the memories and set the menus to their firmware defaults. It isn't useful for "fixing" and real problems. > and then re-load my image, but that doesn't help. And if RESET could fix this issue, reloading your image just changes your radio's memory back to the way it was before you reset it, breaking it again. > > > Do I need to somehow re-load the firmware? You can't reload the firmware. The firmware is fixed and cannot be updated or changed. > Here is the firmware as listed > in CHIRP: > > > Firmware Message 1: F5R3407 > > Firmware Message 2: F8HP-1 > > 6+Power On Message 1: 150412N > > > If anyone on this forum has had any experience in fixing this particular > problem with their BF-F8HP, or can offer any guidance as to how I can fix > it, please, please let me know. If this is a software/memory issue, you can "fix" it by uploading the original image that you downloaded from your radio. It would set the radio's memory back to the way is was when you got it. Did you happen to save your original memory state as a backup before you started making changes? If you didn't know to or forgot to make this backup, normally I would tell you to download a "factory" image from a collection of "factory" images found here: http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/ Unfortunately there isn't an F5R3407 "factory" image available. I do have some F5R3407 images that aren't "factory" that you are welcome to try. > > > I also have a UV-5RA, which is excellent, and of course my Yaesu FT1-DR is > wonderful as well. From: R Pryor MAEd CETsr
Topic: 50889 Message: 50897

Yes I changed that function on the newer radios so it will skip the weather.

It has to be done via software though, what you can do is this

All weather is from 162.400 to 162.550 at 25 mhz increments

162.400
162.425
162.475

---- all the way to

162.550

So what you can do is figure out the weather station best for your area and program that number in freq mode – leave in the radio so when you change frequency mode from channel mode it is there.

Then delete the weather channel from programming which removes it from scan . You can listening to weather by using frequency mode instead and dialing it in

Subject: Re: [baofeng_uv5r] Programming Local Weather Feception

Yes.

I don't have my license, yet, but I have programmed my UV-5R to the regional frequency with no issues.

Well, except one. I you program your radio with other frequencies, and let it do a 'scan', because the radio squelch controls, when it 'hits' the weather frequency that you programmed, it will stay on that frequency. This is because it is always broadcasting.

You can move up or down on the controls, and it will start scanning again.

Set the correct step size, ensure the rest of your programming is correct, then try the repeater.

Programming from the keypad you cannot set it to not transmit at all, but you can set it to transmit on some frequency outside the operating range or on a legitimate frequency you are licensed to use.

Hi Pete,

What you posted is correct when using CHIRP. Bob stated in his original post that he does not have software. The advice that he needs is how to do this using the keypad only.

50904. CHIRP programming a receive-only channel

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-14 16:18:33 UTC
From: Calum Mackay
Topic: 50904 Message: 50904

Would someone please tell me exactly what I need to set, in CHIRP, to program a channel as receive-only?

I tried setting duplex=OFF, but when uploaded to the radio, it results in odd behaviour: once touch (and release) on the PTT button and the red transmit light comes on, and stays on, indefinitely, even though the PTT button is not being held down. I then have to turn off the radio to stop it.

I assume this can't be right...

Do I need to set the other split fields to something, or should duplex=off on its own be enough?

thanks,
calum.

Jerry, download chirp, and set it up that way, it is not that hard, as I am 57 and getting slower as the time moves on, you only need to program chirp once, and save the file, then use it to upload to your radio.Al KG7OLQ

Hello Bob,

I was able to program successfully my uv5ra twice just now with no problem into a local repeater.
The only problem with manual programming is you cannot set it to RX only. That HAS to be done with program software.

If you are going to key in the TX frequency manually. There is no need to set menu 25 or menu 26.

And don't forget to set the other parameters like transmit power level, bandwidth, etc before you set the RX frequency. If you don't, then you must erase the memory and start over.

From: w8jvf@...
Topic: 50879 Message: 50913

John,

Just curious, when you press and hold the "0" key, what is your battery voltage?

Here is why. (Something I've found for you Jim) On some of the BF-F8HP's, (yes I have three of them and a UV-5RTP) If the battery voltage drops below 7.3-7.4 and you go to transmit, and the radio is set to High power, it will shut down any RF out. (actually it's more like .1W on the Meter) I thought I had burnt out the finals on my BF-F8HP which caused me to buy a replacement, and when I put a fresh battery in the "burnt out radio", I was back to full power out on High. Try switching to Medium or Low power and try it again.

Don't know if anyone else has seen this problem, and I've been meaning to post something about it on here, but keep forgetting (been quite busy lately).

Hope this helps...

73!
James
W8JVF

From: John Tibbetts
Topic: 50879 Message: 50914

James,

The battery voltage is at 8.2V. I've tried medium and low power as well, and also tried all of my freshly-charged batteries. Jim sent me 3 different factory image files, none of which solved the 2m no Tx problem. 2m Tx is just dead on my radio.

I think it's time to find my receipt, box it up, and contact Baofeng Tech to see about getting a replacement radio.

I thank everyone for their help!

John, W9APX

You have to resave to memory if you want to keep it on high power. When you change channels and go back, the radio uses what was in memory, not vfo.

Yes. The firmware listed is from a radio with 3 power levels. The
BF-F8HP model should be selected.

First suggestion would be that it's probably not a great idea to give your callsign while talking about using a radio that is illegal to use.

Second suggestion would be to follow the directions to download from the radio first, then edit or copy the data, then upload to the radio.
You cannot upload an previous image file from another radio - you have to download the image from your radio then edit or copy the data into it, then upload it.

If you have your channel set on low power then manually change it to high power, your radio will work on high. If you change channels or frequencies then go back to the first channel, it will go back to low power, as that is what is saved in the memory. If you always want to use high power, you need to resave the information in that channel, using the high power setting.

The one at the beginning is some type of 5-tone ANI or paging. I didn't watch the whole video.

Baofeng only has DTMF. You can't put it on your radio.

There are several multi-tone formats common in Europe that use different sets of tone frequencies.
They are listed on page 4 of this document:
<http://www.midians.com/pdf/tone-signaling-charts.pdf>

I don't know which format was used in the video.

UPDATE: I bought the BF-F8HP from an eBay dealer, who only has a 14-day return policy. Lesson learned: buy only from Baofeng Tech, which offers a year warranty. So I ordered another one from Baofeng Tech, it should arrive on Thursday. Jim, I will download the factory image from the radio and send it to you, along with the firmware numbers.

I'll keep the radio with the burned-out 2m final, for parts. Maybe I'll open it up soon to see if any solder joints came loose.

while testing a newly received UV-5RC , the battery discharged and the handy stopped .
Later after recharging the Receive audio, beeps and announcements are all OFF . Virtually the Rx is silent, even if we press the moni key.

Tried to test the board with the schematic (thanks to the site files), suspect TDA2822 failure as supply was coming on pin2 while moni key pressed.
a Trial with external audio signal, the amplifier did not respond.
had ordered for smd TDA2822.
I shall update after getting the chip.
can any one share their experiences please !!

Billy,

Yes, I read the press release. Apparently you didn't understand my concept of greatly new and improved. While some of the Boafeng cheerleaders stand up and appauld every tiny new variation within the product line (which I agree has some small value), it's not like the radio is completely different, is it?

Bumping up a power level from 5 to 7 watts gets nearly nothing in real world performance difference, as has been discussed many, many times on various forum sites. Since the UV-82HP will now consume MORE of the battery reserves while on high power, it really would be nice if a true extended battery were available, which was not announced.

So the advantage of more power at 7 watts is really of very little value, except in marketing to new users.

Yes, it will be of some value for a few folks to be able to lock the VFO/MR mode through software, but if the user is already familiar with the programming software (and the ability to lock the radio), I'm not sure how valuable this option will be for the majority of users.

Same issue (for me at least) with the idea of the synchronized PTT switch. I suppose a few users will find that handy, but since the UV-82 series has been out for a number of years, I think most of the UV-82 users are quite comfortable in knowing how to properly operate a simple PTT switch, so again I'm not sure how valuable this option will be for the majority of UV-82 users.

Multiple tone-burst options will be nice for our European friends, but very few repeaters in North America use tone-burst. Still, for some users (especially in Europe) this feature will be a nice addition, but for the majority of UV-82 users (that are in North America), this added feature won't be used much.

As to the manual, it will be interesting to see if it's nearly a page for page copy of the free internet based manual started by Len several years ago, or if they really made their own this time (unlike most of the BF-F8HP manual).

So in my opinion, this new radio is a minor upgrade to the existing UV-82 series. It still lacks FCC Part 90 certification, it still has only 128 memories, and it still lacks the ability to add a true extended battery or a "AA" shell pack. Whether or not it's worth more than twice the price of an existing UV-82 radio will clearly be up to each user. In my case, I will probably try one just to check it out, but I doubt it will become my standard UV-82 radio to carry around. You may decide otherwise....

Interesting points, but since a normal consumer is not a dealer (as yourself) - and don't have a heated rub against baofengtech.com (as your posts continuously do) - its nice to see something actually changing instead just a name change or case change. Since the 5R has been out for few years - Baofeng has taken very little steps towards something different - but from what it seems - this is one of those little steps.

Thank you for your completely irrelevant trolling reminder that we do still have a handful of people here from other lands. However in this case we are talking about a model that is available only from a single seller, located in the United States, who primarily advertises and sells the radio to customers in the United States.

So, if you are interested in trying to convince this US-based seller to ship you one of these radios, and are willing to pay the cost of shipping, and take the chance that your customs service may choose to hold the radio on arrival because it isn't approved for those frequencies in your country either, you go right ahead -- and please tell us all about your experience with this radio if it ever arrives.

Billy,

What you don't seem to understand is that I personally own many different radios from many different vendors (including Baofeng) by being in radio for over 34 years, and when I offer a viewpoint it's based entirely from my end-user's perspective, not how much money we might make selling that particular brand vs. another.

That variety of radio ownership over a long period of time provides, I think, a great deal more perspective on most radio products than many other folks have, especially if they only own one brand of radio or have been involved in communication products for a relatively short period of time.

For the record, Baofeng radios offer a great deal for those users that are either solely, or at the very least primarily interested in a very low price *and* are willing to live with some of the lower priced radio's shortcomings. My only "issue" (if you wish to call it that) is when a dealer or manufacturer takes advantage of new users with slick marketing tactics that are, at the very least, purposely misleading or confusing.

Case in point is Baofeng Tech, a dealer (not the manufacturer) that claims to be located in a tiny town in North Dakota - but pretends to actually be Baofeng corporate in many of their remarks on website pages and/or e-mails. One example is their "comparison list" of radios they sell.

A quick look at that list would seem to indicate that all STANDARD UV-5R radios are discontinued (not true), or that the Baofeng Tech branded BF-F8HP radio is the only tri-power radio available from Baofeng (not true), or that they (and they alone) are the only Baofeng source for accurate information on the entire Baofeng radio product line (again, not true). So yes, guilty as charged if I point out misleading marketing statements from time to time (be they from a dealer or manufacturer), but in my defense, I also do that same thing with AnyTone, Kenwood, Icom, Motorola, Relm, TYT, Wouxun, and Yaesu when I see it.

My name is "Bill" and not "Billy", thank you
"What you don't seem to understand is that I personally own many different radios from many different vendors (including Baofeng) by being in radio for over 34 years, and when I offer a viewpoint it's based entirely from my end-user's perspective, not how much money we might make selling that particular brand vs. another."

---> Coming out of the Amish over 45 years ago; and getting into Amateur radio as my first "sin" - Your perspective and lack of experience seems quite irrelevant to me

"Case in point is Baofeng Tech, a dealer (not the manufacturer) that claims to be located in a tiny town in North Dakota - but pretends to actually be Baofeng corporate in many of their remarks on website pages and/or e-mails. One example is their "comparison list" of radios they sell. "

---> There site clearly has a different logo and their own name, states they are a distributor, and has an about us page not even close to what I would expect from a manufacturer, their comparison list you refer to seems pretty straight forward (https://baofengtech.com/comparechart).

Not sure where they claim to be the manufacturer, the closest I am seeing is stating the are Baofeng's official distributor with the ability to support products they sell. (and on their page it seems they have an automated repair form - so it seems like it is a qualified statement)

"A quick look at that list would seem to indicate that all STANDARD UV-5R radios are discontinued (not true), or that the Baofeng Tech branded BF-F8HP radio is the only tri-power radio available from Baofeng (not true), or that they (and they alone) are the only Baofeng source for accurate information on the entire Baofeng radio product line (again, not true). So yes, guilty as charged if I point out misleading marketing statements from time to time (be they from a dealer or manufacturer), but in my defense, I also do that same thing with AnyTone, Kenwood, Icom, Motorola, Relm, TYT, Wouxun, and Yaesu when I see it. "

---> Calling radios they no longer sell or offer - "discontinued" - seems like a logical way to not be prompted to sell it - if they say they don't have it up front.

What's misleading are disgruntled vendors that seem to know it all and downplay or overlook different radios - but it is interesting that your shop is unheard of, (because it doesn't seem to offer anything new or different). so when a business is doing better than yourself and actually makes an effort - you go off and hold a continuous grudge.

Bill,

Since your email starts out with billy, I'm sure you can see how easily the mistake could me made, I meant no disrespect.

As for the rest of your statement, I don't hold a grudge, otherwise I wouldn't be attempting to communicate with you on this issue, but I sense your mind is made up, so no matter what I say it will be wrong and you'll be right, so let's just say we'll agree to disagree and let it go at that.

I suppose we'll have to throw up a website on Amazon for you to consider us a real player. Perhaps we'll do that someday as well.

Cheers.

Actually all the new boards are coming with the ability to bump up the power levels.

It would be good to see more accessories for them though.

The 6 port charger was a good accessory, that is about the only thing I have seen come out.

Subject: Re: [baofeng_uv5r] Re: UV-82HP anyone?

Billy,

Yes, I read the press release. Apparently you didn't understand my concept of greatly new and improved. While some of the Boafeng cheerleaders stand up and appauld every tiny new variation within the product line (which I agree has some small value), it's not like the radio is completely different, is it?

Bumping up a power level from 5 to 7 watts gets nearly nothing in real world performance difference, as has been discussed many, many times on various forum sites. Since the UV-82HP will now consume MORE of the battery reserves while on high power, it really would be nice if a true extended battery were available, which was not announced.

So the advantage of more power at 7 watts is really of very little value, except in marketing to new users.

Yes, it will be of some value for a few folks to be able to lock the VFO/MR mode through software, but if the user is already familiar with the programming software (and the ability to lock the radio), I'm not sure how valuable this option will be for the majority of users.

Same issue (for me at least) with the idea of the synchronized PTT switch. I suppose a few users will find that handy, but since the UV-82 series has been out for a number of years, I think most of the UV-82 users are quite comfortable in knowing how to properly operate a simple PTT switch, so again I'm not sure how valuable this option will be for the majority of UV-82 users.

Multiple tone-burst options will be nice for our European friends, but very few repeaters in North America use tone-burst. Still, for some users (especially in Europe) this feature will be a nice addition, but for the majority of UV-82 users (that are in North America), this added feature won't be used much.

As to the manual, it will be interesting to see if it's nearly a page for page copy of the free internet based manual started by Len several years ago, or if they really made their own this time (unlike most of the BF-F8HP manual).

So in my opinion, this new radio is a minor upgrade to the existing UV-82 series. It still lacks FCC Part 90 certification, it still has only 128 memories, and it still lacks the

ability to add a true extended battery or a "AA" shell pack. Whether or not it's worth more than twice the price of an existing UV-82 radio will clearly be up to each user. In my case, I will probably try one just to check it out, but I doubt it will become my standard UV-82 radio to carry around. You may decide otherwise....

New boards Billy, they can firmware tweak the PA bias to up the power. I am not sure if BT has a contract though with Baofeng. If they paid $ to bring the update to the consumer then they should be contract protected from other vendors under cutting their market.

Problem is Baofeng itself does not protect their dealer chain very well, many Chinese companies operate this way.

I think Anytone does a better job at this or TYT. It is not uncommon to see a Baofeng radio advertised below dealer costs online. Unless of course you are the sole distributor of the product. I am not sure in this case. However, many 8W Tri-power Uv5R variants are on the market now. I am sure that drops the prices deeply, chances are these uv82's have the new sets in them and software upgrades and BT is getting a production run with all new boards.

Interesting points, but since a normal consumer is not a dealer (as yourself) - and don't have a heated rub against baofengtech.com (as your posts continuously do) - its nice to see something actually changing instead just a name change or case change. Since the 5R has been out for few years - Baofeng has taken very little steps towards something different - but from what it seems - this is one of those little steps.

50951. Using programming cable rookie: UV5R goes transmit mode when cable plugged in

Yahoo group: baofeng_uv5r (2015)

Just got the Baofeng programming cable, have the prolific USB-Serial Driver showing up in my device manager BUT when I use Chirp to read from data from the UV5R, the rig goes HT goes in to transmit mode when I plug the cable into the HT and no data is read . Any suggestions? I tried pulling the connectors at the HT out a little, transmit does stop but no data is read, so I assume the connected is not making contact. When "snug" contact is made, the transmit light comes on.

The instructions say radio OFF when plugging in and then ON just before
telling Chirp to read data. When I turn on the HT, with the cable plugged
it to it, the HT goes in to transmit.

I've been having the same problem with the UV-82 and UV-B6. For the UV-82, I also found a work-around (start upload, turn on radio, wait for upload to fail, start upload again), but haven't figured out the cause of the problem. My guess is the serial port or the Prolific chip gets in the wrong state when there is no active serial connection for more than 1 or 2 seconds, but that's only a guess.

Topic: 50933 Message: 50959

That "protection" normally only lasts about 6 months, Rich, and then the various radio "cousins" start showing up.

I can see why BT wants a slightly different UV-82 model, as the price delta on the original UV-82 has fallen sharply over the past several months (they can now be had for what was UV-5R pricing), so these slight product changes allow them to market their UV-82 version radio at a much higher price point (for now at least). Considering their target customer base, that's really pretty smart, as the strategy mirrors their previous BF-F8HP roll-out (a slightly improved product vs. the original UV-5R with a unique part number (and specs that are unique to them for six months or so), then once the TP "clones" arrive, attack the TP clones as inferior product for as long as possible until another "new" product is ready and repeat the previous procedure).

Of course there have been some missteps alone the way, chief among them the massive returns of the early BF-F8HP units to Amazon with the beep bug due to new firmware bugs (I returned two units myself) and the new fallout on the two Anytone Tech products (that claimed FCC Part 90 and 95 certifications but didn't have them). I haven't checked this week, but as of last week neither of the two higher-end Anytone Tech units are even listed on Amazon (not even as out of stock or on back-order, the page listings are just gone).

I'm sure that will eventually get fixed, perhaps by simply dropping the claim of Part 95 certification and getting the radios certified for Part 90 alone, or perhaps by dropping Part 90 as well and marketing it as a step above the UV-82 from Baofeng (with no FCC certs at all).

I really don't mean to "stir the pot", but could somebody tell me why a radio being part 90 certified be important or even relevant to the amateur radio market?

I mean I don't do any part 90 work, I don't use my radio for commercial applications, and I just don't see the need for a radio for amateur use to be part 90 compliant.

Thanks...

I do not blame them to have their own version. If they do not do this, every crook, moron and cheat will return defective units (that they bought elsewhere) back to them expecting a free replacement. They tried doing that to us before we dumped the common Uv5R internet versions. The cheap Chinese radios seem to bring out some of the biggest deadbeats at these shows.

At least when they get a return back they will know it is from BT and not from unscrupulous HK dealers. They also insure the BT logo is not easily peeled off and had them in a distinctive plastic case. This prevents people from peeling off stickers to get a new one.

However, I have seen one case where they disassembled a radio and switched cases to get a new one. Pretty comical since they did not put it back together well. Too bad they did not realize the Firmware could be read and was not one of the models we sold regardless of the case. I would bet BT will have the new Uv82’s in a slightly modified case.

This last show I had 1 theft, my experimental 10 M HT that had a military PRC 148 tape measure style flat HF antenna one it. Radio can be replaced but that antenna was a good match for that radio. It will be hard to find another one.

Sad thing it was stolen during setup which means it was another vendor that most likely took it between trips unloading stuff from outside. Now I have to watch out for fellow vendors too

At least no fake $100 bills given to us this show or use of EBT cards. Had one guy come in and try to write down everyone’s call signs so he could run to QRZ and look all of us up hoping he could report one of us for some violation to the FCC, other than temps over 105F it was quiet.

Interesting points, but since a normal consumer is not a dealer (as yourself) - and don't have a heated rub against baofengtech.com (as your posts continuously do) - its nice to see something actually changing instead just a name change or case change. Since the 5R has been out for few years - Baofeng has taken very little steps towards something different - but from what it seems - this is one of those little steps.

It is only needed if you do use it for business, fire dept, Search and Rescue, etc. if you don't do any of those types of things, don't worry about it. I do SAR and need part 90 radios to talk to the non hams involved on a search. We are trying to get everyone livensed, as you can do so much more on ham than public safety.

James,

No problem at all with the question. You're correct that Part 90 certification applies to the commercial market and not the amateur market, the problem (from a marketing perspective) is that many (most?) of the Chinese manufacturers tout their radio's Part 90 certification as an attempt to sell their product(s) into the commercial world as well (which is a much larger market than ham radio). When they can market their product(s) across multiple market segments it's really a win for them, as the same product(s) can be sold into a larger overall space.

That's the primary reason Anytone Tech was trying so hard with their TERMN-8R and OBLTR-8R models to claim both Part 90 and Part 95 certification, so they could claim that their radio(s) could work within multiple market segments. "If" Anytone China is anything like Baofeng China, their exclusive window for those two models may already be getting quite short, which may be causing Anytone Tech some headaches if their products won't be available soon (due to unforeseen delays caused by the FCC denying Anytone Tech's claims of both Part 90 and Part 95 approval).

Another issue that they may be dealing with is what to do with whatever inventory that they had, plus whatever returns happened through Amazon when folks purchased radios (based on previous claims of Part 90 and Part 95 certification) and then returned them (through Amazon) when they found out they weren't. Most hams probably could care less (as Part 90 and 95 doesn't apply), but commercial users probably did, and many GMRS or MURS users probably did.

Rich,

Sorry to hear that Las Vegas was a bust for you guys. We've thought about doing some shows up there from time to time, but we either have a conflict with another show or one of our vendors has some event we have to attend, etc. We've been having a harder and harder time even getting some of the show promoters (of late) even providing a simple floor plan layout for booth spaces we do plan to attend (six weeks of asking so far and still nothing, I guess they never heard of MS Visio). If they wait too much longer we'll probably back out (Elecraft and RT Systems have already that I know of).

I think I came out basically even after expenses. However, a good excuse to go to Vegas for a weekend. This was the first theft I had ever in Vegas. Hope it is an isolated incident.

I guess I will look for a surplus PRC 148 antenna or just build one myself that has the flex ability from tape measures..

OK... so bottom line, We as amateur radio operators really don't care if a radio is part 90 or not.... unless you're working with SAR, public safety, or commercial interest.

Got it. I thought so (at least when I studied for my test) that this was the case, so I'm just going to go back to modifying my radios, playing with my antennas, having a good time, and tearing apart CCJ's to see how they work, and maybe make some improvements.

This is NOT an amateur radio -- despite the fact that the amateur radio service is the only service where it can be legally used in the US or Canada.

Believe it or not, some people do have commercial applications for their radios.

Believe it or not, some people who have commercial applications for their radios also prefer to follow the regulations.

And, when both the manufacturer and the vendor made a major selling point of wide transmit frequency coverage outside the amateur bands, obviously they are expecting the radio to be bought for and used on those frequencies.

Marketing a radio specifically to operators who CANNOT use it legally should tell you quite a bit about the ethics of the vendor.

WHOAH!!!! Easy there killer (Xaun)... didn't mean to get your blood pressure up.

I never asked about "illegally using the radio". I only asked why Part 90 certification would matter to the amateur radio community, and that question was answered by another member (Jardy and Craig) who did a fine and through job of answering. Very politely I may add. I guess when you're public safety entities use a digital encrypted trunked system, you never even consider having your own radios to interface with that. .

There really was no reason for a diatribe about the scruples of any radio vendor. That topic has been beat to death.

It isn't. It's relevant if you use them for PMR and want to keep your paperwork in order. It's a bit less relevant if you don't mind about the paperwork but want to keep within the specs for the band you're using.

It seems relevant to those few who see themselves as FCC enforcement agents; perhaps they're on commission.

First, as several have noted, Part (whatever) certification is not applicable to amateur use. The issue is that for any non-amateur use there are very specific operational and technical requirements, one of the most significant is that the radio cannot have VFO capability which is of course almost essential for amateur use.

Prior to the influx of Chinese radios over the past couple of years, radios targeted to the amateur community could not be programmed outside of the amateur bands (at least without some type of hardware modification, such as removing a jumper inside the radio). While making such a modification would enable you to program non-amateur frequencies, it did not make the radio compliant with the applicable Part of the FCC rules.

Similarly, radios targeted to the non-amateur community had no (user accessible) VFO capability. The radio shop supporting the non-amateur licensee (city, business, etc.) would program the radios to whatever that entity was licensed on, and that is the only thing they could be used for. That is a key piece of non-amateur radio approval, or certification. You can hand the radio to any employee or agent and they can't use it outside of the license requirements (can't go to some other frequency, can't change transmitter power, etc.). So the end user didn't need to know anything except "go to channel 3 and press push to talk", and there were no channels programmed that they were not authorized on (per the license).

Enter the low cost Chinese radios, which attempted to target both markets. The issue, or concern with them is that it puts the ability to program any frequency into the hands of those who do not know or understand the regulatory requirements (rules, license specifications, etc.). You don't even have to go inside the radio and "cut the green wire" or "remove zero ohm resistor R27", or whatever to "open the radio" to non-amateur capabilities.

Within this forum, perhaps the biggest concern (among some of us) is with regard to those who specifically do want to use the radio for non-amateur purposes and have absolutely no knowledge of, or concern for, the applicable rules (either or both). And this applies not only to the U.S. (and the FCC), but to anyone, as every country does have it's own rules regarding radio use, and almost without exception, they are similar in principle, even if the particular frequencies vary (which they certainly do).

It isn't my "job" to enforce radio regulations, but I do try to inform and educate. An analogy, I can teach someone how to drive, and what the traffic laws are without being a law enforcement officer and enforcing those laws.

See my previous on this. Part 15 is required for amateur use. It addresses the receiver tolerances and certifies the radio cannot receive cellular. That's why you will see an fcc. ID on any big 3 radio. The part 90 automatically includes the part 15 approval, which makes the whole part 90 important. If they really wanted to make an amateur only radio, all they really need to do is get certified as a Part 15 scanning receiver.

The uv5R does not have a kill or stun function. Maybe you posted to the wrong group as the mobiles like TYT and others have this function which can be shut off via software.

I shut all the ones I have off.

Perhaps your local Police department is far more tech savvy than most, but if you made that call here it would be ignored, plus I doubt they would be inclined to spend any time enforcing FCC regulations as they typically have their hands full with local matters.

I got a call about 30 min ago from someone pumping for info about what channels to transmit on. Whole convo sounded fishy, most likely an attempt by some Ham to see if I would help anyone operate these radios outside the band or help someone without a license.

Strange since 50% of my table is full of license getting materials and a DVD with license requirements and resources are given with each radio.

Claims DVD did not work
Wanted FRS info for xmt
Seemed to play the role of a VERY uniformed person..However could ask particular technical questions that ONLY someone trying to Fish around for something to pin on someone for illegal activities. A complete radio dunce (as the guy claimed he was) would not know about Part 95 certification and MURS power requirements would they? Humm.

Remember: The sole responsibility is the user- if you transmit without a license or outside licensed bands – IT IS YOUR FAULT.

A poor attempt to try to set someone up, possibly record the conversation (illegal in this state) and run to the FCC.

Strange calls all day

It isn't. It's relevant if you use them for PMR and want to keep your paperwork in order. It's a bit less relevant if you don't mind about the paperwork but want to keep within the specs for the band you're using.

It seems relevant to those few who see themselves as FCC enforcement agents; perhaps they're on commission.

Actually No

There are two completely different kinds of Part 15 certification (intentional radiators and unintentional radiators) but neither kind is included in Part 90 certification.

All radios (and just about every other kind of electronics) have to meet the requirements of Part 15 as unintentional radiators (which is to say that the radio may only put out a very low level of RF when it is NOT transmitting). This is completely separate from Part 90 certification which has its own set of standards.

From: mailto:baofeng_uv5r@yahoogroups.com

Because the part 90 certification includes the part 15 certification that all commercially manufactured vhf and uhf receivers require for sale in the USA.

You will find that you don't have to have any software loaded on the computer for this to happen. I have 2 such cables that do this no matter the divers or computer software on UV3R series, UV5R series and UV82. The fix was either a genuine Prolific or genuine FTDI cable and drivers. I tried the driver fix and on the counbterfeit it made no difference on Baofeng branded cables. I replaced the cable with those in the $25 price range and all problems ceased. Maybe driver fixes work for some... Just didn't for me. As long as the cable was powered by the PC and the radio connected, it was forced it into TX until the TOT setting ended it.

Just my experience.

---In baofeng_uv5r@yahoogroups.com, <rdbeer@...> wrote :

Jim,

I've carefully checked all three of those, and even cut off part of my cord plug to ensure it seats fully. But I'm having the same problem on 3 Baofeng HTs and with 3 different PCs with both Linux and Windows 7. So it seems to me it must be either the Baofeng firmware, the CHIRP software, the Baofeng/Prolific adapter cable, or the v3.2.0.0 driver that is the problem.

I see someone has their Mr Grumpy hat on today:-)

I disagree, as I am entitled to do, that my post was and is irrelevant. The Baofeng radios, and all their variants are sold in great numbers all over the world. The US and Canada are just part of the picture. There may be a higher percentage of postings to user groups like this one from US based members and there may even be a higher percentage of US based members. But this does not mean that users and members in other parts of the globe are not permitted to have a voice - maybe it is that we just don't have as many issues:-) Or that we have less interference issues to deal with. I may place a poll to see what the member base is made up from. No point scoring involved, or intended - but a chance to see how our groups' membership base is spread. I can probably say it would be a higher number of US/Canada based members as there seems to be more licensing/interference "part 90 etc" issues to deal with and owners of radios will join groups like this one to air their issues.

As far as your comment about this model only being available from one vendor in the US - this is totally and utterly wrong. The model in question is available from a number of other global outlets. For example the UV-82 has been available in ZL land, from a number of diferent sellers since it was first released. The vendor who I buy my Baofengs from gets them direct from the manufacturer. So no - why would I be the least bit interested in asking a US based seller of the UV-82 to send me one when I can get one here in my own country for a super discounted price??

We do have strict laws regarding the sale and ownership of radios that are capable of being used on amateur frequencies. When such radios are listed on our country's main online auction website the vendor must state that the equipment can only be sold to and used by an Amateur radio operator, on Amateur frequencies. All such auctions and sales are monitored by the RSM - our equivalent of the US FCC. If a vendor/seller mentions in their auction description that the equipment is able to be used on frequencies outside the ham bands, or answers a question on one of their sales in a similar manner - they may lose the right to sell such gear on the site. None of the Baoengs, Puxing etc radios are type approved for any commercial use or use on our 80 channel PRS CB band - 476 Mhz. Having said that - there are sites and outlets that also advertise and sell the same radios for people to use in airsoft (paintball sport) and they do get programmed and used on the PRS radio channels. Our eyes and ears can't be everywhere ALL the time. Usually such outlets are reported to the RSM by an Amateur operator who comes across such sales as we do not want unlicensed people just plugging in any old frequency for their airsoft comms. We probably don't have the same level of IQRM as our Stateside based fellow Hams but we do get some intentional repeater interrupters (I won't call them jammers) and unlicensed operations on simplex and occasionally repeater input frequencies. Then there is the problem of the raios being inadvertently/intentionally being programmed with commercial frequencies - like fire and ambulance.

So hopefully my posting will serve to enlighten other members in other parts of the globe how it is in New Zealand. Myself - when I make a posting to a globally reaching audience on a user group such as this I try and make sure I word my postings to make reference to

conditions and laws governing use in my own country. If we all did something similar, not only does it provide more clarity and relevance to the the issues and the postings, it also shows an awareness that we are not the only pea in the pod.

I do have a couple of questions regarding firmware/images/programming, but will leave that for another post.

Enjoy this fine hobby most of us are part of.

Hi everyone. I am looking for some help programing my Baofeng UV-5RE. I am hoping that there is a Mac Guru out there that can help me as I am new to Mac Computers. I have a MacBook Pro that was giving to me and I was thinking about moving all my ham related stuff to it. I am using Chirp to program the Baofeng.

I am using OS X Yosemite (version 10.10.3). In the System Information I can see that it recognizes the Prolific USB cable, but when I ask it to read from radio it doesn't find the USB port in Chirp. I know it is not a cable to radio problem, because I can unplug it from the Mac and plug it directly into a PC and it work properly there. Also, it appears that chirp is working properly on the Mac, and I did as instructed on the Chirp download page by downloading and installing the KK7DS Python Runtime Prior to installing Chirp. I have tried both versions of Chirp, the legacy release and the daily build, with no differences.

When Chirp asks for the port to read from the radio, it only sees the following ports:

/dev/cu.Bluetooth-Incoming-Port
/dev/cu.Bluetooth-Modem

Do I have to type in an address similar to com ports on a PC? I hope someone can direct me to a solution. I would hate to just be able to use the MacBook as an internet and email computer.

Thanks in advance,
Robert May

You should be able to do this with no issues with your setup. I am running something very similar on my iMac.

Chirp should be reading a couple of USB ports on that computer. should read something like:

/dev/cu/usbserial1

I have 3 ports on mine, and it reads each of them.

what does it say under:

about this mac>system report>hardware>usb

It should show the USB Device tree and you should see a few USB entries (bus and/or hi-speed bus).

Assume that other USB devices work on these ports? You said it was new to you, so wasn’t sure if you tested those yet.

It will not be in the uv82 or uv5R package. Most likely they cannot make a tri-band yet for $30.

AnyTone has a good Tri-band, but again they are not $30 and the 3318 E/F model is still backordered for production.

Good radio though.

Baofeng has a prob with their mobile and even their A58 sales because buyers expect models under $50 when made under the Baofeng name.

Both of those models sell over $50 I would expect their Tri-band to be close to or over $100 which would would be too high for the average Baofeng buyers. Most likely the tri-bands will be from Wouxun, TYT or Anytone

Thanks Mike and everyone else who responded. I guess the old cliche about "the third time is the charm" is true. I had gone through the Mac tips I thought at least two times. But, just to make sure I went through them again and it now is working.

Thanks again,
Robert

Subject: [baofeng_uv5r] Baofeng/Chirp on MavBook Pro

Hi everyone. I am looking for some help programing my Baofeng UV-5RE. I am hoping that there is a Mac Guru out there that can help me as I am new to Mac Computers. I have a MacBook Pro that was giving to me and I was thinking about moving all my ham related stuff to it. I am using Chirp to program the Baofeng.

I am using OS X Yosemite (version 10.10.3). In the System Information I can see that it recognizes the Prolific USB cable, but when I ask it to read from radio it doesn't find the USB port in Chirp. I know it is not a cable to radio problem, because I can unplug it from the Mac and plug it directly into a PC and it work properly there. Also, it appears that chirp is working properly on the Mac, and I did as instructed on the Chirp download page by downloading and installing the KK7DS Python Runtime Prior to installing Chirp. I have tried both versions of Chirp, the legacy release and the daily build, with no differences.

When Chirp asks for the port to read from the radio, it only sees the following ports:

/dev/cu.Bluetooth-Incoming-Port
/dev/cu.Bluetooth-Modem

Do I have to type in an address similar to com ports on a PC? I hope someone can direct me to a solution. I would hate to just be able to use the MacBook as an internet and email computer.

Thanks in advance,
Robert May

Rich and Jardy are both correct. Anytone has at least two tri-banders that I know of, one HT and one mobile. "If" you are lucky enough to find or have one of the original white on black display TYT TH-UVF9 ht's, you have a tri-band unit without knowing it. Both the 2m/70cm unit and the 1.25m/70cm units transmit and receive just fine on the "other band", even though nothing in the paperwork or manual indicates it will. Of course you will need to get a tri-band SMA-M antenna. I may have to list some of those for sale .....

Craig I have one of the reverse display F9 I got it by mistake it was supposed to be a F9D. I will take a look at it, the unit is still in the box.

The ANY Tone 3318 E/F is a pretty good radio for the price but availability is not there yet. I saw one being advertised for $230, other than that they are hard to find in quantity. Our estimated production avail was pushed back from July to mid-August.

Most likely these will be between 130-180 each depending on factory prices, but should be under $200. Of course you are not going to get it for $30 which will make it too expensive for the typical Baofeng crowds I deal with here. Who knows maybe Baofeng will come up with a Tri-band version in the future around $50? However, I doubt it.

I do think it will be higher than the Uv8D versions which seems to be a good seller here with off road groups.

Rich,

Just don't try to program the "missing" band with your software, that won't work, but if you manually enter 223.500 (for example) on the 2m/70cm radio it transmits and receives just fine, plus the TYT units allow you to "name" the channels from the keypad.

Graham,

Xuan certainly doesn't need me to stick up for him, but I believe he was referring to the new "high power" 7w UV-82 radio, callled by BaofengTech the UV-82HP. Certainly the normal 5w UV-82 version has been available for a while all over, but I think you'll find that the 7w UV-82HP is only available at BaofengTech (for now at least). If it really is available in your neck of the woods, that is good news.

Yes the TYT UV9D are great I have a few of them, just be careful the third band is not 320-399 MHZ which will not be useful for Ham radio.

The uv9D I still have in the box is Wouxun which is the upgrade model from the uv8D. I just got it a few weeks ago so still NIB

TYT’s version are a step up from Baofeng, but of course you pay for it.

A really decent triband is the Anytone 3318 E/F model which has a good RX including AB. MW and LW. It has the MSK freq hopping text message capability and tri-bands of 70cm, 2m and 1.25 M

I feel this is a good radio for those that want to up from the Baofeng radios These might be the best deal radio of the Summer for price and capabilities.

thats the tri-band uv9d in the above link.

they blatantly advertise it as so too. picked up a couple myself...

will start to look for a yahoo group for this ht.

Rich,

Just don't try to program the "missing" band with your software, that won't work, but if you manually enter 223.500 (for example) on the 2m/70cm radio it transmits and receives just fine, plus the TYT units allow you to "name" the channels from the keypad.

On Sat, Jun 20, 2015 at 12:31 PM, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Craig I have one of the reverse display F9 I got it by mistake it was supposed to be a F9D. I will take a look at it, the unit is still in the box.

The ANY Tone 3318 E/F is a pretty good radio for the price but availability is not there yet. I saw one being advertised for $230, other than that they are hard to find in quantity. Our estimated production avail was pushed back from July to mid-August.

Most likely these will be between 130-180 each depending on factory prices, but should be under $200. Of course you are not going to get it for $30 which will make it too expensive for the typical Baofeng crowds I deal with here. Who knows maybe Baofeng will come up with a Tri-band version in the future around $50? However, I doubt it.

I do think it will be higher than the Uv8D versions which seems to be a good seller here with off road groups.

Rich and Jardy are both correct. Anytone has at least two tri-banders that I know of, one HT and one mobile. "If" you are lucky enough to find or have one of the original white on black display TYT TH-UVF9 ht's, you have a tri-band unit without knowing it. Both the 2m/70cm unit and the 1.25m/70cm units transmit and receive just fine on the "other band", even though nothing in the paperwork or manual indicates it will. Of course you will need to get a tri-band SMA-M antenna. I may have to list some of those for sale .....

Richard,

I hate to say it, but I'm not all that impressed with the Wouxun UV9D. I sort of like the UV8D better, and if the UV8D had a mid power setting, I would sell my UV9D in a New York minute. I just can't put my finger on it as to why, I just do. I'll have to use it some more to find out why, but it's like when I was going back and forth between the 8W Baofengs (BF-F8HP and the UV-5RTP), I find myself grabbing the F8HP before the 5RTP.

I'm funny like that. But don't get me wrong, the UV-9D does work VERY well, and it scans like everything, but the UV8D just "feels" like a better radio. Does any of that make sense?

Sorry for the "stream of consciousness" type of post, but I'm pretty beat.

Pull it out and use it. A couple of good things though, it will charge in the UV8D charger, and the size and weight feels good in the hand. You just have to use it to see what I mean. But it may "feel" different to you. I guess it all depends on what you like in a radio. I'm working on a full review, but I like to use a radio for a good solid month before I give a firm opinion on it.

51015. UV5R Plus Backlighting problems.

Hi,
Just purchased a Baofeng UV-5R Plus and the backlight seems to have to defaulted to orange for everything.

When the transceiver receives a signal the green LED lights, the backlight momentarily goes orange and then goes out. The radio has been reset but the backlight still lights up orange for everything, standby, receive and transmit. When I first received it yesterday - all backlight colours worked as they should. The firmware is shown as BFB297. Going into the menu and setting the separate colours - changes nothing. Everything still lights up orange.

Anyone got any ideas what could be wrong ?? The radio is at factory default settings but backlighting is still orange only.

Thanks for any help on this one.

Richard

Hi Richard. If you go into the menu section you can change the TX/rx lighting in there.

Hi Chris,

Thanks for the reply. I've done this several times and chosen other colours (blue or purple) and 'confirmed' the selection but it still remains orange for everything, Even reset the radio using 'all' where the thing should revert to purple for standby, blue for receive and orange for transmit (so the menu settings tell me) but - the backlight remains orange for everything. I'm a bit lost.

Haven't received the programming cable yet - so I'm doing everything from the menu.

Thanks again.

Richard

Hello Jim,

Many thanks for the detailed response.

Unfortunately I have not yet received the programming cable for the radio yet - I ordered one but it hasn't arrived. I have Chirp downloaded and installed however.

I will follow your instructions when I get the cable, and if I can locate the correct file to download - I'll try and restore the factory defaults. If this does not cure the problem then I will have to return the radio for a replacement. Locating the correct firmware file may be an issue however, but I will initially save the current firmware to a file on the PC via Chirp before I do anything else.

Thanks again Jim. Your response is appreciated.

Richard,

Even if you can't find a "factory" image, one from a working radio having the same firmware version should work. In addition to the firmware collection that is on-line, I have many other images that aren't quite "factory" but may help.

Also, if you radio is "fixed" by uploading an image from a working radio, then I would definitely like to get a copy of your image from your non-working radio. I like to compare working and non-working images to try to learn what each bit in memory does.

Good luck and 73 for now,
Jim KC9HI

Hello Jim,

Thank you very much.

The radio is brand new - I only received it on Friday. So I wouldn't have a clue what image file to download in reality - that would match what it originally was. My e-mail address is g4ugb@... <mailto:g4ugb@...> and if you had any files that you think might fit what I need - I'd be grateful if you could perhaps e-mail them to me. However the file sizes may be too large for attachment, I don't know.

Once again thank you. As previously mentioned, I don't have a programming cable yet. I ordered it from Amazon at the same time I ordered the radio.

51027. SMA Male bulkhead connector

Yahoo group: baofeng_uv5r (2015)

From: earlg@...
Topic: 51027 Message: 51027

I use my UV5R regularly when riding my ATV. It is connected via bluetooth to my helmet communicator (uClear). The trouble is it is always getting full of dust and sometimes rain. My solution is to put it in a waterproof Otter Box. I would like to mount my Nagoya 771 on the box with a SMA Male bulkhead connector. Ideally this would be a pigtail with the SMA male bulkhead on one end and a SMA female on the other end. After a bit of a search on Amazon and eBay it seems this particular configuration is difficult to find.
Any suggestions?

Depending on what your computer platform is and whether you purchased one of the Chinese cables (less than $20) or a genuine one ($20 - $30), you may have a whole other set of issues with the Chinese ones. But your source for help with that as with everything Baofeng is miklor.com.

Hi Chris,

Thanks for the reply. I've done this several times and chosen other colours (blue or purple) and 'confirmed' the selection but it still remains orange for everything, Even reset the radio using 'all' where the thing should revert to purple for standby, blue for receive and orange for transmit (so the menu settings tell me) but - the backlight remains orange for everything. I'm a bit lost.

Haven't received the programming cable yet - so I'm doing everything from the menu.

Thanks again.

Richard

Did you get the heavy duty radio bags made for Marine use? They are pretty strong the floatation orange color is the best one to get. I cannot puncture those bags very easily.

Different versions exist those are the better versions, another idea is to use the rubberized cases in a radio pouch

Rich,

Like with any other radio product (Japanese or Chinese), there are usually only slight differences between each company's radio. Many will like the Wouxun 9D simply because it allows AM aircraft receive, but won't like it as well as the Wouxun 8D because of the higher price. I don't think the 9D has an extended battery or "AA" shell pack option yet either, but I'm sure Wouxun is working on those options.

Campos,

If you like in a country where the 350-400 MHz band is available to you, then you'll love the TYT TH-UVFD, but for those of us in the U.S., the 350-400 MHz band can't be used by hams (although I understand some folks can use this band), so for most of us, that 3rd band is useless.

Earl,

When I need to find a really difficult connector or assembly, I've have great luck with a small company in Congress, AZ called "RF Stuff". Their website isn't slick like Amazon's, but they literally carry hundreds of different RF connectors, many of which they don't even show on their website yet (http://www.rfstuff.com).

Two thoughts.

First, hard mounting the antenna may well give you a chance to see if it will hold up to the increased pounding of the brush you ride through since it will not be able to rock and slide by the brush.

To save that, I'd suggest mounting it atop a piece of flexible but hard to bend wire, like that off of an old mobile antenna or a salvaged car AM/FM antenna. That way the antenna would be up and out of the brush.

Second, hard mounting will give you the option of adding a real ground plane. A set radials which you could fold down over the outside of the box or run down the side of the antenna mast (yea, I know, a radial laying against the mast is not too good, but still might show improvement). It may well enhance the antenna's behavior beyond that of just having the radio chassis and your body as a counterpoise.

Some things to consider.

Stan

Earl,

I get where you're coming from. A Gallon Zip Lock bag is definitely DEFINITELY NOT durable for the application you're using it on. (sorry for sounding like rain man there)

Go a little outside the box on this one. It may cost you a little more money, but go with a 771 SMA MALE connector. Buy Two Way Radios has them at a good price. Then you can get your pigtail that's SMA Female/SMA Female on both ends (since the SMA Female bulkhead is so readily available).

But one thing I would consider doing is to throw a "tiger tail" off the antenna side of the connector. Ring terminal, piece of wire about 20" long, and bam. Instant ground plane. It will help increase your range and also improve the SWR of your setup since the antenna system actually uses the radio body for its ground plane.

With an SMA Female poking out, you could put a rubber O-Ring around it, and get a little more weather protection (since you're using an otterbox I would assume you want this) and it will protect that junction.

As I'm sitting here thinking about it, you might be able to run the tiger tail along the inside of the box, but you'll get better transmit if it "hangs" outside. Either way, if you're using a short jumper (like 6") from the radio to the pigtail then having the tiger tail either on the outside or inside won't make much difference on "heating up" your radio. I actually have a setup where it's an otterbox clone box, that with the lid open, the radio is held upright, also holds the charger, and the lid "lip" has an SMA female bulkhead with tigertail hanging off. Speaker mic on the radio. It's what I use when doing net control for events where we provide coms. I'd send you a picture, but I gave the box to a buddy of mine who's doing some stuff for the scouts this week.

Hope this helps.

Buy the components (sma female, sma male bulkhead, cable) and talk to
your local radio club. Someone is almost certain to have the crimp tools
and dies necessary to assist you.

These is what we use here on the boats.
http://www.409shop.com/409shop_product.php?id=123506

Some will cut out a plug and epoxy it to a waterproof mic and strap the bag on. These yellow ones have cushions for floatation and you can beat them up good. They will not tear.

Subject: [baofeng_uv5r] Re: SMA Male bulkhead connector

Earl,

I get where you're coming from. A Gallon Zip Lock bag is definitely DEFINITELY NOT durable for the application you're using it on. (sorry for sounding like rain man there)

Go a little outside the box on this one. It may cost you a little more money, but go with a 771 SMA MALE connector. Buy Two Way Radios has them at a good price. Then you can get your pigtail that's SMA Female/SMA Female on both ends (since the SMA Female bulkhead is so readily available).

But one thing I would consider doing is to throw a "tiger tail" off the antenna side of the connector. Ring terminal, piece of wire about 20" long, and bam. Instant ground plane. It will help increase your range and also improve the SWR of your setup since the antenna system actually uses the radio body for its ground plane.

With an SMA Female poking out, you could put a rubber O-Ring around it, and get a little more weather protection (since you're using an otterbox I would assume you want this) and it will protect that junction.

As I'm sitting here thinking about it, you might be able to run the tiger tail along the inside of the box, but you'll get better transmit if it "hangs" outside. Either way, if you're using a short jumper (like 6") from the radio to the pigtail then having the tiger tail either on the outside or inside won't make much difference on "heating up" your radio. I actually have a setup where it's an otterbox clone box, that with the lid open, the radio is held upright, also holds the charger, and the lid "lip" has an SMA female bulkhead with tigertail hanging off. Speaker mic on the radio. It's what I use when doing net control for events where we provide coms. I'd send you a picture, but I gave the box to a buddy of mine who's doing some stuff for the scouts this week.

Hope this helps.

Hi Jim,

Thanks again.

Yes, I have read about the cheaper programming cables - to be honest - I think I probably ordered the cheaper one off Amazon. So I am re-ordering another Prolific based one today as well.

Thanks for the tips - I'll get back to you when the cable has arrived and I am able to 'talk' to the radio. I'll also send you the 'broken' firmware that is in the radio at present so you can take a look at it.

Richard,

If you order another programming cable, you want one with an FTDI
chip, not another one with a Prolific chip.

51052. Hand mike problem - not working at all.

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-22 15:32:07 UTC
From: Tom Gregorski
Topic: 51015 Message: 51052

Hello,
I am not to the forum and to this hobby. I have purchased my radio a few moths ago and I quickly discovered that it need some accessories. I have ordered a few things as well as the hand microphone. I tried to plug it in today to see how it operates and perhaps to use my radio in the car. I can not keep it in my hand since it has an upgraded antenna which is much longer than the original one.
The radio is installed in the universal "grip" bracket sitting in the cup holder. (I have not used a battery eliminator at this point or the external antenna.)
After I plugged in the external mike there was no sound and the PTT button on the mike seemed not to work. When I pulled out the plug everything came back to normal.
This is a $5 mike and it has Baofeng "logo", also it has some metal rotating piece at the back.
Do I have to enable anything on the radio to get it working?
Thank you!
Tom

Tom,

It sounds like you are either not getting the mike plugged in fully or
it is defective. There is nothing that you have to do to the radio to
use and external accessory like this.

51054. Engraved Logos?

Yahoo group: baofeng_uv5r (2015)

Quick question. Do Baofeng/Pofung radios have to have the brand engraved to be considered the real thing? I read some seller ads that warn against counterfeit units (as if counterfeiting isn't a big thing in China).
I have two UV-5R variants: a UV-5RE, which I acquired pre-owned earlier this month. I also have a brand new UV-5R, which I got in the mail just today.
The UV-5RE is branded BAOFENG, and has engraved logos on the belt clip, near the battery release switch, charger (bottom and front) and the battery itself. It also has the longer type antenna (which I understand usually comes with facelifted variants). The rear part of the chassis (where the battery slides in) is chromed and has BAOFENG engraving, too.

The UV-5R is branded POFUNG, and has no logo engravings whatsoever, even on the chassis.
Oh, it also has the audio bug, in which audio and RX disappears when "beep" is turned off (I have since learned to live with it).
The boxes are also differently sized. Should I be concerned that I may have purchased an inferior device? Or are these just manufacturing quirks?
I've attached photos for reference.
Any advice?

Look at the back of the radio label to see if you have a radio that was designed for sales overseas or one designed for the U.S. (see picture).[image: Inline image 1]

Richard,
or anyone else can answer this,
I'm trying to send you my personal thoughts on the UV9D, but I still have not learned how to send an offline message yet.
Yep, I'm an idiot when it comes to this stuff.
Is there an easy way to do this?

No,

This means a third party has their version with cooperation from Baofeng. The batteries, the accessories are provided by other part sources. Certain companies can buy what is needed from Baofeng and from the part suppliers. Generally, they CANNOT mark them as Baofeng but need to have the radio marked with their product line or generic for the accessories.

Sometimes those companies (battery manu for example) make a non marked generic battery without the Baofeng sticker at a much lower price, they are using the same components to do this too. The price difference could be varied. Same for the charge base company, belt clip (plastic manu’s sell to anyone these designs)

Baofeng sells components generally to these other companies, so any reports that they are FAKE is not true, unless it is sold as Marked as Baofeng and not under the third party name.

Some are mixed depending on what parts they have and come this way from Baofeng.

Baofeng will sell components to anyone with an open wallet and that extends to their part suppliers.

Any claims you have to buy from a PARTICULAR COMPANY because only THEY sell real products or better products generally is NOT true unless it is a distinct model change that they solely market.

You will see a lot of cut-throat stuff going on concerning these cheap radios where a dealer priced version will be offered less than what the dealer paid for them or at costs.

With really low profit margins expect to see all types of claims one product is better than another. WHAT you need to be careful of is getting used returns or factory rejects which are sold well below costs to unload them to dupes online. Sometimes this is hard to figure out until you program them and they do not work. Generally really old firmware is another sign it sat somewhere until it could be unloaded.

Bottom line: When profit margins are low and various players are in the game, expect many companies to make claims that their version is the best and the other versions inferior.

To add to Rich's previous comments, it depends on how you define fake as well.

Many, many folks sell the overseas version of the radios (without FCC Part 90 approval) to thousands of U.S. based customers through the internet (Amazon, E-Bay, etc.). Some sellers would clearly call those radios "fakes" as they are cheaper versions of the radio not meant for U.S. sales, but other sellers would not.

FCC Part 90 approval costs dealers more, and some would debate if the actual "approved" radio is indeed better, tighter specs, etc., but what's not in debate is the additional cost, which generally costs dealers about $12 to $15 more (depending on quantity purchased) for FCC Part 90 approval.

Sorry, Jaems, It is easy using any method EXCEPT reading the posts on the group website. I don't recall if it was the most recent change (aka "neo") or the last change before that - but fairly recently Yahoo eliminated several things you used to be able to do from the groups website - among the things eliminated have been the ability to send or forward emails outside the group and the ability to reply directly to the poster of a message.

In their infinite 'wisdom' Yahoo even deletes the domain name from the sender's address when you view the full headers of the message in a group -- even though they include all that information on every email that they send out.

You probably aren't THE ONLY person who uses the group website, but doing it that way has so many limitations that there are relatively few who stay with that method very long.

I forget sometimes as well that not everyone has high speed internet available everywhere. I myself have been forced to download large files occasionally over 3G. What normally takes seconds at home or at the office can sometimes drag on for what seems like forever.

Xuan,

I don't think Chris was complaining about his choice of email client as much as the speed from his ISP. You must remember that some folks still think DSL is fast. I know many of my California vendors think nothing of sending 20+ MB files to us, since most of them are on fiber.

You can select the Daily Digest then. You will get one email containing either the last day's messages compiled into one email or I thing it is the last 25 messages, whichever comes first. Then you have all the capabilities referenced by Xuan from each individual message in the digest.

51075. UV5R comms with the PC

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-23 17:13:04 UTC
From: Richard Bracegirdle
Topic: 51075 Message: 51075

Hi Jim,

Well, I received the FTDI programming cable. Installed it - driver reports installed OK on COM12 in Device Manager.

Run Chirp (latest daily download 20150623) and run 'Download from Radio' - set com port to COM12 - but no comms with the radio at all.

Chirp is set to COM12 and the correct radio, vendor and model is displayed in the box - the cloning box appears briefly and then disappears and an error comes up 'An error has occurred - Radio did not respond'. The UV-5 is switched on - cable plugged in and volume at 100%. Battery fully charged.

PC is running Windows 8.1 64 bit.

No idea at the moment why this is happening.

Need more time to investigate.

73 de Richard

Hello Jim,

Truly sorry to be a nuisance. This is all new to me. (as you can tell !!)

Now I have the communications between Chirp and the radio working (thanks to John !!) I find that my UV-5R radio has the following firmware:

N5R2407BFB297

And there is no factory file with that name available on the Miklor firmware downloads. I tried downloading the factory BFB297 file and uploading that to the radio but the error message:

An Error has occurred.

The upload was stopped because the firmware version of the image (Ver BFB297) does not match that of the radio (N5R2407BFB297)

So - any clues where I should proceed from this point in to try and restore the radio to the original factory firmware to see if this cures the issues with the backlighting ?

As I understand, the firmware is factory set, and cannot be redone.

What worked for me, is to use CHIRP to download the contents
of the radio. Make the changes, and then upload.

It's a matter of terminology...many will consider the .img file to be "firmware" when in fact it's really just a bunch of settings so it's more of a "config" file.

I'm not sure anybody has every agreed on what to call it exactly other than an image of the radio.

CHIRP will refuse to upload an image from a different image version. It used to allow it but that can brick your radio (good reason to use daily snapshot of CHIRP).

Getting a factory-fresh image of your firmware is the whole idea of erratic recovery. So that's what he needs.

Ok let me look for a factory most my uv5R radios are at another location but I am sure I have a factory 2407 I do not have a recovery though as Jim and the Chirp folks make these from the factory versions.

I have had the strange issue of the same fault reporting they do not match the 2407 when the file is a a 2407 !!

I would just use the radio original and build upon that, this has happened a few times. I renamed some of them 2407 ODD as they would only work with this error version.

You can try one of my odd versions if you want, it has some channels on it but at least the backlight portion works to see if it helps or not

Load this imagine and see if it corrects your prob, until you can get a reset image. This was my factory with the channels added and works with the error that the firmware is NOT a 2407 when indeed it was a 2407.

Wow, you guys sure do have to jump through a lot of hoops to get Chirp to work correctly with every firmware change. RT Systems may cost more, but they deal with the hassle of the ever changing Baofeng firmware so I don't have to.

CHIRP works correctly with every firmware version just like RT Systems does.

The only problem anybody ever has is when they try to load a different image version into their radio. CHIRP will load the channels but not the rest of the config.
I don't know what RT Systems does in that case but it can't do any better than that.

Wow, you guys sure do have to jump through a lot of hoops to get Chirp to work correctly with every firmware change. RT Systems may cost more, but they deal with the hassle of the ever changing Baofeng firmware so I don't have to.

Ok let me look for a factory most my uv5R radios are at another location but I am sure I have a factory 2407 I do not have a recovery though as Jim and the Chirp folks make these from the factory versions.

I have had the strange issue of the same fault reporting they do not match the 2407 when the file is a a 2407 !!

I would just use the radio original and build upon that, this has happened a few times. I renamed some of them 2407 ODD as they would only work with this error version.

You can try one of my odd versions if you want, it has some channels on it but at least the backlight portion works to see if it helps or not

Load this imagine and see if it corrects your prob, until you can get a reset image. This was my factory with the channels added and works with the error that the firmware is NOT a 2407 when indeed it was a 2407.

The BFB297 is what all UV-5R's report now – the REAL version is N5R-2407 and you're correct that there doesn't appear to be an image of one on the recovery site.

So if anybody has one they could contribute I'm sure Richard would appreciate it..

Hello Jim,

Truly sorry to be a nuisance. This is all new to me. (as you can tell !!)

Now I have the communications between Chirp and the radio working (thanks to John !!) I find that my UV-5R radio has the following firmware:

N5R2407BFB297

And there is no factory file with that name available on the Miklor firmware downloads. I tried downloading the factory BFB297 file and uploading that to the radio but the error message:

An Error has occurred.
The upload was stopped because the firmware version of the image (Ver BFB297) does not match that of the radio (N5R2407BFB297)

So – any clues where I should proceed from this point in to try and restore the radio to the original factory firmware to see if this cures the issues with the backlighting ?

Oh, I've used VIP, Chirp and RT Systems, and RT Systems is *by far* the easiest to use. Of course it helps considerably that they use an FTDI cable (and not a cloned or fake Prolific cable), but different radio firmware versions are a zero issue (or at least have been to date). I simply do a read from radio and then upload the file. The software takes care of the issue(s) involved with mixed firmware on different radios.

Hi,

And thanks for sending the file N5R2401BFB297 I tried loading it into my UV-5R but the error message then said:

'An error has occurred.

The upload was stopped because the firmware version of the image (N5R2401BFB297) does not match that of the radio (N5R2407BFB297).'

And reading the other messages ref this topic it seems that there is no default factory file for this radio that I can get my hands on.

I think I will send the UV-5R back as faulty with this backlighting issue. I cannot see any other way of resolving it.

Thanks to everyone for your help.

Thanks to Baofeng, the firmware version of the data file being
uploaded must now exactly match the firmware version of the radio or
the upload will be aborted.

I checked though my CHIRP Radio Images and found the file you need. It
should be available shortly.

Oh sorry

I need the 2407 to send to you.

I sent you the 2401 it seems I misread the 7 as a 1.

I will look for one, but Jim should have one soon. I am going to start keeping the factory files from now on and if Jim needs them I will send to him which then can be put on John's Miklor site.

I do not think I have a 2407 but have programmed them recently, I just did not save the factories.

Well, each radio owner is free (no pun intended) to pick whatever version of radio programming software they prefer, but if you seriously think you really "save" money by using freeware, consider this example (and yes, I realize that I'm making some basic assumptions, so modify the model below to fit your individual situation):

365 days per year - 104 days off (52 weekends per year) - 10 more holiday/vacation days leaves 251 "work" days. Figuring most folks take an hour for lunch (or just mess around during the work day for at least 60 minutes per day) leaves a 7 hour work day. So 251 work days x 7 hours per day equals 1,757 work hours per year.

Now here's where it gets tricky, divide your total income by 1,757 hours and you'll arrive at a number that tells you what you make (or did make if your are retired) per hour while at work. My ROI for RT Systems software is less than an hour, your numbers may be different.

I would also argue that older folks "should" value what time they have left on earth even more than the young guns, but I realize that not everyone would agree. I prefer to spend my free time on hobbies, family, etc. - not tweaking drivers to make fake cables work, or trying to figure out why my new radio won't take an older template without more steps.

In the most basic manner possible, I equate time to money, so spending another 15 to 30 minutes one day getting Chirp or VIP working again (on top of the many other times I needed to tweak it) was quickly costing me too much time and effort. So I paid somebody else $48.95 (Amazon and RT Systems) to do the "work" and they handle the various radio issues that crop up, they support me with an 800 toll-free number, plus all of RT Systems Tech Support is based in Denver, CO. I also get lifetime software updates by simply clicking on the software tab.

Plus, if a new radio comes out (like the new 10 watt TYT TH-8000D dual-band or the Wouxun KG-UV9D dual-band), I don't have to wait weeks (or even months) for somebody else to buy one and send it off to the Chirp development team (which I agree does a thankless job). Since RT Systems charges for their product (which I think is worth every penny), they can afford to actually purchase radios and be working on software development before the new radios even hit the streets.

So I agree that if you value the worth of your time at zero cost, Chirp or VIP will always appear less costly (up front), but once you realize that your time is worth "something", RT Systems has a very quick ROI for most people (that take the time to analyze the true cost). In case some folks still feel that their time is worth nothing, please email me off list as I'm sure we can find something you can do for one of the company's I own

(no matter where you live) if you are still willing to work for free.

I have some RT software that was purchased before some of the other choices were available. Yes, it works fine, but on some radios, it just did basics, no other settings. I find it interesting that software and a cable should cost more than a radio. I make $12.00 before taxes and benefits are taken out. Thus, I need to work over 6 hours to pay for a $50.00 item from RT.

I have no problems with my fake Prolific cables, because I have read the FAQs and have checked the Miklor site to know how to fix the problems. I appreciate the endless efforts of those that do CHIRP across such a wide variety of radios, and KC8UNJ for his work on Yaesu and Wouxun radios. I have probably over 30 radios in my collection, probably 15 different makes/models. 15x$50.00=$750.00. And alot of those radios can and do use the same cables.

From: w8jvf@...
Topic: 51015 Message: 51094

Nah... still like CHIRP better than RT Systems. I use only genuine chip cables and never had one problem with CHIRP, because once you upload your image, it's locked in.

Don't get me wrong, RT systems has a GREAT product, it's just not for me.

Some people like to tinker and figure things out and some people like a nice pretty package. There's nothing wrong with these two schools of thought, and it doesn't always apply to everything. I like to build my own antennas, and buddy ham of mine likes to buy the latest and greatest antennas. On the flip side, my buddy likes to fix up old POS cars, and I like to just take my new car and have somebody else change the oil.

Another comparison I like is Ham Radio Deluxe vs. Logger32. HRD is like CRAZY expensive, and Logger32 is free. HRD comes in a nice neat package that does EVERYTHING! BUT I didn't learn anything with it. Logger32 comes with some basic interfaces, but along the way I'm learning about scripts, interfaces, and some basic computer tweaking. Sure HRD is up and running in less than 30 min and you can take up to 8hrs getting Logger32 to do everything that HRD does automatically, but I've actually learned something along the way.

Give the man a fish he eats for a day... Teach a man to fish...

Different strokes for different folks. I like your analogy of time/money as it applies to CHIRP. The only problem with that is it's not the program that is in question, it's the fake cables that people use. CHIRP is a solid program when you use it with a real cable. When you use a counterfeit cable the software won't work. In fact you'll get the same problems with RT Systems by using a counterfeit cable.... no wait. I almost forgot. You can't even use a genuine FTDI chipset cable with RT Systems. You have to use "THEIR" cable. Maybe if they sold their software to be used with any cable I would look into it more. But $50.00 per radio if you change interfaces?

Nah.... I'll stick with CHIRP. I like the challenge. It's kinda fun to figure things out and actually start getting into the developer functions of the programming side of the house.

I've looked all over for the technical specifications for the actual operating voltage range on the UV-5RA radio. The battery states it is 7.4 volts but I am sure the radio can operate a little over and a little under 7.4 but I can't find anything documented.

Can anyone help me out?

Subject: [baofeng_uv5r] Voltage range on the UV-5RA?

I've looked all over for the technical specifications for the actual operating voltage range on the UV-5RA radio. The battery states it is 7.4 volts but I am sure the radio can operate a little over and a little under 7.4 but I can't find anything documented.

Can anyone help me out?

From: johnpsummers@...
Topic: 51098 Message: 51098

I'm sure this has been covered before but I couldn't find it... When I am trying to store a repeater's info into a memory channel, everything will transfer over and store correctly except for the offset. It always reads all zeros.

Any help?

Thanks!

Hello money saver!

ref: income calculations rt software etc

Thanks for you fine commercial promotion. After reading this i am shocked, not considering

to buy this 50 USD software. The funny "milch maedchen" calculation is really fascinating.

Thanks GOD we have "chirp"! Chirp does all as promised - for all my radios:
Chirp is satisfction pure! An importand benefit of chirp is, that i have not to harm with calculating my income in EUROS per second!

By the way...

Can we return to the nice BAOFENG radio speech?

This is an unprogrammed image file taken via Chirp, from an N5R2407. Exactly what came out of the radio when it was unboxed.

Hope that helps,

73 de Stan, G4EGH.

I kinda reckon my hobby time is priceless.

I have spent a lot of time getting things to programme correctly, asked a few questions, made a few contributions, and most importantly, made a few friends, as a direct result of playing around with the UV-5R.

I use Chirp, it is well supported, and free...(If you choose it to be, I decided it was worth something, and donated).

The UV-5R is the worst radio I ever had. From a "receiver performance on a big antenna" point of view. It is by far and away the BEST radio (I own several, actually) I ever had, in terms of getting use from it, and all the friends I made, and the experimentation, both with a service monitor, and with the software.

All for less than $29. Or £18.50 in the UK. That is five pints of beer and one headache, or hours of fun with a small radio... :-)

YMMV,

73 de Stan, G4EGH

Jardy,

If you have 30 different radios you obviously have figured out a way to own them (even at the $12 an hour pay rate you claim), but many of those radios probably use the same Kenwood style programming cable, so your math is flawed, since RT Systems would gladly sell you their software only (no cable) at $25.00 each, thereby cutting your example cost by 50% (15x25=$375, not $750).

RT Systems (a company I can only wish I owned) doesn't price their software based on the cost of the radio being programmed, it's based on the value you receive, so an RT Systems software package for a multi thousand dollar radio (from Kenwood, Icom or Yaesu) costs the same as the software for your Baofeng UV-5R radio. Since it's highly likely that they will probably get far more requests for tech support help from the UV-5R crowd (based on sales numbers alone) vs. those from Icom IC-9100 owners, it's probably a safe bet that they make less per package selling the Baofeng software.

My point wasn't that you could not successfully use freeware, it was that freeware isn't really free, as you yourself have invested many hours in both learning Chirp, fixing Chirp, keeping up with bug fixes, etc., etc. To me, time equals money. You may argue that time spent learning and supporting Chirp or VIP is like learning a foreign language, it's an investment. My counter to that is if I could hire someone to speak Mandarin for $25 (the cost of the RT Systems software alone) and be available whenever I needed them (for life), it would really make little sense for me to spend years learning the language, especially if I could also hire (for $25) someone else that could speak Spanish for my next trip.

Yes, the Chirp development folks have invested countless hours themselves in developing and supporting their product as a labor of love, and I understand that, but you can't deny that their freeware model counts on others to supply them with loaner radios (there are still several models of my Wouxun radios that are either not supported at all, or have very limited support). I'm sure that there are many others I could add as well if I looked.

That lack of capital prevents them from quickly supporting various new radios, or new models of radios (remember how long it took for the 220MHz version of several Baofeng models to be supported)? I currently have on my desk a Wouxun KG-UV8D (that's only partially supported on Chirp, a Wouxun KG-UV9D and a TYT TH-UV8000D (neither of which are supported by Chirp at all), yet all three have RT Systems software available right now.

I went to the NM State Hamfest/Convention last year, showed Rod from RT Systems a 220/440 TYT TH-UVF9 dual-band handheld I was carrying at the time (they had a booth there), and asked him when they planned to support it. He asked me if I would be back tomorrow (Saturday) and then spent time that night working on their TH-UVF9 software product to add 220/440 support. The next day I was able to fully program my radio using their software. Sorry, but without capital, you can't get that level of support (from anybody).

Again, I'm not knocking the Chirp freeware project, and so long as they are willing to work for free, god bless them, but sooner or later they (and their users) will realize that free doesn't pay the bills.

You guys have provided some great info...Thank you!

Yeah, since the charger cradle charges at 8.4 vDC I figured that maybe 8.6 or 8.7 was the top end. 6dDC sounds about right on the bottom end but I will take the advice test it with my multimeter. I just figured that somewhere there had to be a "spec" on it. But then again, it is from China. Great radio, but lacking on good documentation that isn't third-party.

Thanks again guys!

Like i mentioned before, i have bought RT software for radios that did not have other programs (whether CHIRP or something straight from. the factory), but this is for $300.00 mobiles. The others i would either do manually or look for factory software. I have never gotten VIP to work on my Baofengs (3), but haven't had too as CHIRP works just fine. Follow simple directions as found in the FAQs and Miklor site, and the RT software has been unnecessary. Once you get the software to work, how much lifetime support do you really need?

51111. crackling on receive

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-24 19:42:00 UTC
From: Calum Mackay
Topic: 51111 Message: 51111

hi all,

Has anyone ever come across a UV-5R with an intermittent crack/click on receiving?

The received audio is otherwise perfect, and remains so if I keep the receiver perfectly still. But if I move it about at all, I get these loud, random clicks over the top

I've got this with my new BF-F8HP; I had it previously with a UV-5R, which I returned; the replacement was fine. I can't easily return the F8, since it came from the US (I'm in the UK).

I tried changing aerial, and battery, and it makes no difference. Tried different TX radios too.

Has anyone else ever come across this?

I've yet to test with the headset; I'll do that next.

thanks much,
calum.

"Once you get the software to work, how much lifetime support do you really need?"

Well, if you just follow many of the questions seen on this forum for even a week, it would seem that not everybody is able to use Chirp as easily as you. Just saw another posting earlier where an individual never could get his Baofeng programmed, so now he's trying to sell it.

From: stanwhite_snr@...
Topic: 51095 Message: 51114

You charge to 8.6V and you will have a cell whose cycle life is very short, and the possibility of a battery fire. You charge to 8.7V and you will have a battery fire.....

Charge to 8.4V and all should be OK.

Charge to 8.2V and you will get an 89% charge into it, and double the cycle life. Check earlier posts from me on how to make the charge stand do that automatically, for nothing more than a Schottky diode, and a 20k trimmer resistor.

Discharge too far, and the radio will suddenly go off. A voltmeter on the battery will show no volts. Don't leave it like this for long.

If you want to store a battery long term, charge to about 7.8V, (40%).

All you need to know about your battery can be found at Basic to Advanced Battery Information from Battery University http://www.batteryuniversity.com

51115. Re: [baofeng_uv5r] crackling on receive

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-24 20:40:28 UTC
From: Tom Consodine ND5Y
Topic: 51111 Message: 51115

I have a UV-5R and UV-82. Both make a geiger counter like crackling or clicking noise when moving. It is worse on UHF. I am not able to determine what causes it. Apparently it doesn't happen to everybody so it may be interference from something that is always there like nearby TV or FM stations. I have never heard the same thing on any other radio.

Tom

Topic: 51015 Message: 51116

That's probably because they are not willing to look at the FAQs and follow the instructions on the Miklor website. They probably want someone else to do it all for them.

Jardy Dawson WA7JRD
Nobody really cares what device you are using, as long as YOU like it!

>>>
>>> RT Systems (a company I can only wish I owned) doesn't price their software based on the cost of the radio being programmed, it's based on the value you receive, so an RT Systems software package for a multi thousand dollar radio (from Kenwood, Icom or Yaesu) costs the same as the software for your Baofeng UV-5R radio. Since it's highly likely that they will probably get far more requests for tech support help from the UV-5R crowd (based on sales numbers alone) vs. those from Icom IC-9100 owners, it's probably a safe bet that they make less per package selling the Baofeng software.
>>>
>>> My point wasn't that you could not successfully use freeware, it was that freeware isn't really free, as you yourself have invested many hours in both learning Chirp, fixing Chirp, keeping up with bug fixes, etc., etc. To me, time equals money. You may argue that time spent learning and supporting Chirp or VIP is like learning a foreign language, it's an investment. My counter to that is if I could hire someone to speak Mandarin for $25 (the cost of the RT Systems software alone) and be available whenever I needed them (for life), it would really make little sense for me to spend years learning the language, especially if I could also hire (for $25) someone else that could speak Spanish for my next trip.
>>>
>>> Yes, the Chirp development folks have invested countless hours themselves in developing and supporting their product as a labor of love, and I understand that, but you can't deny that their freeware model counts on others to supply them with loaner radios (there are still several models of my Wouxun radios that are either not supported at all, or have very limited support). I'm sure that there are many others I could add as well if I looked.

From: Craig Carnahan
Topic: 51015 Message: 51117

No doubt a lot of that is true, but that also tends to prove my point, you (the new owner) have to invest time in learning how to work around the various situations to program your Baofeng radios, little things like how to make a fake cable work, how to properly use the freeware you have selected to use (VIP or Chirp), how to update it once you get a new radio with slightly different firmware, etc., etc. - or you have to get someone else to donate their time to do it for you.

Jardy

I have had customers and others that did not have any computer skills or very limited skills. Generally, these are people over age 50 that have a tech gap. I have had people bring their computers to one of our shows when we have 10 people in line and expect us to drop everything and fix their driver issues that bought radios from Baofeng tech. They figure they could get free support, similar people when I directed them to Chirp claim that the Chirp exe was a virus and wanted us to fix their computers.

The point is RT systems gets ME off the hook, if the person cannot figure out their radio programming, install, cable and want someone to teach them the whole procedure I just tell them to go buy RT SYSTEMS.

This is especially a good way to politely get rid of those that bought radios from someplace else and models we do not sell or support. The problem though is they expect something for free, a free spare cable, a free program (Chirp) free tech support, free accessories, for their $30 dollar radio they bought.

When we used to do Free Programming for people (when I first started this) I found out I was on the hook every time they deleted a channel, reset their radio, wanted a new location programmed in or wanted us to spend an hour on how the A/B and dual watch worked.

NOW they can call RT systems support for these issues as I cannot handle the amount of calls I was getting from unlicensed buyers of products we never sold to them.

Now if only I can get rid of those trying to pawn stolen or junk stuff to us during our shows and get rid of the yellow-stained underwear wearing goof balls that think they are the FCC and want to do a field spot check at our table, things might be much easier for us.

RT systems was a blessing for us.

That's probably because they are not willing to look at the FAQs and follow the instructions on the Miklor website. They probably want someone else to do it all for them.

Well, if you just follow many of the questions seen on this forum for even a week, it would seem that not everybody is able to use Chirp as easily as you. Just saw another posting earlier where an individual never could get his Baofeng programmed, so now he's trying to sell it.

On Wed, Jun 24, 2015 at 12:14 PM, Jardy Dawson JARDY72@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Like i mentioned before, i have bought RT software for radios that did not have other programs (whether CHIRP or something straight from. the factory), but this is for $300.00 mobiles. The others i would either do manually or look for factory software. I have never gotten VIP to work on my Baofengs (3), but haven't had too as CHIRP works just fine. Follow simple directions as found in the FAQs and Miklor site, and the RT software has been unnecessary. Once you get the software to work, how much lifetime support do you really need?

Jardy,

If you have 30 different radios you obviously have figured out a way to own them (even at the $12 an hour pay rate you claim), but many of those radios probably use the same Kenwood style programming cable, so your math is flawed, since RT Systems would gladly sell you their software only (no cable) at $25.00 each, thereby cutting your example cost by 50% (15x25=$375, not $750).

RT Systems (a company I can only wish I owned) doesn't price their software based on the cost of the radio being programmed, it's based on the value you receive, so an RT Systems software package for a multi thousand dollar radio (from Kenwood, Icom or Yaesu) costs the same as the software for your Baofeng UV-5R radio. Since it's highly likely that they will probably get far more requests for tech support help from the UV-5R crowd (based on sales numbers alone) vs. those from Icom IC-9100 owners, it's pr obably a safe bet that they make less per package selling the Baofeng software.

My point wasn't that you could not successfully use freeware, it was that freeware isn't really free, as you yourself have invested many hours in both learning Chirp, fixing Chirp, keeping up with bug fixes, etc., etc. To me, time equals money. You may argue that time spent learning and supporting Chirp or VIP is like learning a foreign language, it's an investment. My counter to that is if I could hire someone to speak Mandarin for $25 (the cost of the RT Systems software alone) and be available whenever I needed them (for life), it would really make little sense for me to spend years learning the language, especially if I could also hire (for $25) someone else that could speak Spanish for my next trip.

Yes, the Chirp development folks have invested countless hours themselves in developing and supporting their product as a labor of love, and I understan d that, but you can't deny

that their freeware model counts on others to supply them with loaner radios (there are still several models of my Wouxun radios that are either not supported at all, or have very limited support). I'm sure that there are many others I could add as well if I looked.

That lack of capital prevents them from quickly supporting various new radios, or new models of radios (remember how long it took for the 220MHz version of several Baofeng models to be supported)? I currently have on my desk a Wouxun KG-UV8D (that's only partially supported on Chirp, a Wouxun KG-UV9D and a TYT TH-UV8000D (neither of which are supported by Chirp at all), yet all three have RT Systems software available right now.

I went to the NM State Hamfest/Convention last year, showed Rod from RT Systems a 220/440 TYT TH-UVF9 dual-band handheld I was carrying at the time (they had a booth there), and asked him when they planned to support it.&nb sp; He asked me if I would be back tomorrow (Saturday) and then spent time that night working on their TH-UVF9 software product to add 220/440 support. The next day I was able to fully program my radio using their software. Sorry, but without capital, you can't get that level of support (from anybody).

Again, I'm not knocking the Chirp freeware project, and so long as they are willing to work for free, god bless them, but sooner or later they (and their users) will realize that free doesn't pay the bills.

Well, each radio owner is free (no pun intended) to pick whatever version of radio programming software they prefer, but if you seriously think you really "save" money by using freeware, consider this example (and yes, I realize that I'm making some basic assumptions, so modify the model below to fit your individual situation):

365 days per year - 104 days off (52 weekends per year) - 10 more holiday/vacation days leaves 251 "work" days. Figuring most folks take an hour for lunch (or just mess around during the work day for at least 60 minutes per day) leaves a 7 hour work day. So 251 work

days x 7 hours per day equals 1,757 work hours per year.

Now here's where it gets tricky, divide your total income by 1,757 hours and you'll arrive at a number that tells you what you make (or did make if your are retired) per hour while at work. My ROI for RT Systems software is less than an hour, your numbe rs may be different.

I would also argue that older folks "should" value what time they have left on earth even more than the young guns, but I realize that not everyone would agree. I prefer to spend my free time on hobbies, family, etc. - not tweaking drivers to make fake cables work, or trying to figure out why my new radio won't take an older template without more steps.

In the most basic manner possible, I equate time to money, so spending another 15 to 30 minutes one day getting Chirp or VIP working again (on top of the many other times I needed to tweak it) was quickly costing me too much time and effort. So I paid somebody else $48.95 (Amazon and RT Systems) to do the "work" and they handle the various radio issues that crop up, they support me with an 800 toll-free number, plus all of RT Systems Tech Support is based in Denver, CO. I also get lifetime software updates by simply clicking on the software tab.

P lus, if a new radio comes out (like the new 10 watt TYT TH-8000D dual-band or the Wouxun KG-UV9D dual-band), I don't have to wait weeks (or even months) for somebody else to buy one and send it off to the Chirp development team (which I agree does a thankless job). Since RT Systems charges for their product (which I think is worth every penny), they can afford to actually purchase radios and be working on software development before the new radios even hit the streets.

So I agree that if you value the worth of your time at zero cost, Chirp or VIP will always appear less costly (up front), but once you realize that your time is worth "something", RT Systems has a very quick ROI for most people (that take the time to analyze the true cost). In case some folks still feel that their time is worth nothing, please email me off list as I'm sure we can find something you can do for one of the company's I own (no matter where you live) if you are still willing to work for free.

I just hope the Chirp team has an unlisted number. I average at least 5 calls or more a day concerning drivers, cables and computer problems and 90% never bought anything from us.

These calls would go on from 5AM till past midnight, prompting me to change numbers. The biggest mistake I made “In the spirit of promoting Ham radio” was to offer free tech help and programming to people at the shows. That lasted 6-months.

it quickly turned into a nightmare, when we finally started charging $25 a radio- all I heard was how we were ripping people off to program their radio they spent $30 for. That money we charged went to charity too. We donated it to disabled Veteran programs.

Next, we had people run off without paying and constant attempts for us to program stuff in for illegal use.

RT systems is the way to go for these people and let them figure out how to do it.

I had one kid show up at a Prepper show that asked us to program his BF 888 he paid $15 for (we do not even sell these). While he was talking to us, I heard a dispatch in the background and the kid says , “See every time I talk someone tells me to get off.”

It was a local hospital Med net.

Now what would all of you FCC types do?

1. Erase his program making it inop or just keep his radio
2. tell him to beat it
3. or put a few GMRS freqs on his cheap radio and insure nothing else was on it?

Yes, that's what I hear, and it's an excellent analogy, thanks; that's exactly what it's like.

I should have said: I have two UV-5R, a UV-B5, and the BF-F8HP. I got this problem only on one 5R (and its replacement was fine), and now the new F8.

So I now have two 5Rs and a B5 that do not have the problem, suggesting it really is an issue with the radios, and not merely local interference.

It was on VHF - I didn't try VHF (but will).

thanks,
calum.

And for a little clarification...

You can program a repeater channel by first keying the RX frequency into the VFO and writing it to an empty memory channel. This creates a simplex channel. Then you key in the TX frequency into the VFO and write it to the same channel thus updating the TX frequency to the new value. Do it this way, it is not necessary to setup menu 25 or menu 26.

However, if you do setup menu 25 and menu 26 with the correct values, you can 1) test the setup by accessing the repeater in VFO mode. And 2) instead of keying in the TX frequency, you can display it by tapping the [*] key and putting the radio in 'reverse' mode.

However, the second method may not work right on the very latest radios. This is because the very latest firmware, when writing to an empty channel, will put the VFO frequency into the RX slot and also take menu 25 (SFT-D), menu 26 (OFFSET) and the VFO frequency. do the math to compute the TX frequency and put it in the TX slot all in the same step. So there is no need to put the radio in reverse mode or to do a second write in the very latest radios.

So be careful, some of the traditionally best manual programming guides many not be compatible with the latest firmware.

If you swing it around pretty good you could be getting multi-pathing. I can re-create it will and yes it is noticeably worse on UHF. Try taking it for a drive. The further the TX source is away the worse it gets because the signal finds more different paths to your antenna.

If it happens without a source signal, then disregard.

---In baofeng_uv5r@yahoogroups.com, <nd5y@...> wrote :

I have a UV-5R and UV-82. Both make a geiger counter like crackling or
clicking noise when moving. It is worse on UHF. I am not able to
determine what causes it. Apparently it doesn't happen to everybody so
it may be interference from something that is always there like nearby
TV or FM stations. I have never heard the same thing on any other radio.

From: J F
Topic: 51111 Message: 51126

We also have two UV5r radios. One has the crackling that was mentioned in the receive mode and the other does not have it. When the radio is first turned on and just in standby on receive it does not start crackling. It does it as soon as you decide to answer a call. I have tried sitting it down so it won't move but can still end up with a off and on crackle. It is not a constant crackle but more of a crackle every few seconds.

The radio is being used outside in the woods with no possible electrical or rf interference. Anyone have an idea on what I could do to fix it? Battery is fully charged, has been changed out with the non crackling radio, and the antenna has been checked.
Suggestions???

Interesting, thanks.

On 25/06/2015 00:29, cprendon@... [baofeng_uv5r] wrote:
> If you swing it around pretty good you could be getting multi-pathing.

> If it happens without a source signal, then disregard.

As far as I can tell, no, it doesn't happen without a source signal.
i.e. if I hold the Monitor button, I don't seem able to hear it. But
then the static noise is much louder without the FM quieting.

I'm not swinging it around wildly though, say just rotating my wrist
from vertical to 45 deg. from that, and back, for example.

My test for this was standing at the foot of the garden, nowhere near
the house (or any others), and it's not a built-up area, so
multi-pathing didn't immediately spring to mind.

And, of course, that fact that it doesn't happen on my other radios, and
the 5R it did happen on was replaced by a 5R that it doesn't.

so, if it is multi-pathing, or other local interference, for some reason
it only affects a few of my radios, even among the same model.

I'd be less annoed if it weren't happening on the new F8 that I can't
feasibly return, sigh.

thanks,
calum.

There were some posts about this a couple years or so ago.

If the noise is caused by multipath then the same thing should happen on any other receiver with the same type antenna in the same locations where this occurs. It isn't normal moving mobile picket fencing type noise. I have never had this noise on any other hand held transceiver or scanner I have ever had. I haven't been able to travel around and see if the same thing happens in places with different TV and FM stations on different frequencies.

I haven't used any other CCR that has the RDA1846 transceiver chip. Maybe be that's where the problem is. Maybe it's a problem in the chip or the way Baofeng implements the chip. Maybe it is because of the crappy front end or some other poor engineering by Baofeng.

Attachments: 1 described; binary payloads are missing from this source WARC

This is an issue that has been around for as long as the UV-5R has been available. Attached is a paper that was written soon after they were released that explains the problem and describes a cure for those that are comfortable opening up their radio and doing some delicate soldering.

Rich,

Have you also had the folks that come to the booth or store and ask you to read their existing data from the radio, re-sort it some other way, upload the new data file, and then expect that for free as well? Had another one last week with his BF-F8HP (which we don't sell). His friend programmed the radio for him (for free I guess) and he thought everyone that owned one would also do it for free.

Since he refused to pay anything, I reset his radio back to his friend's original template and sent him on his way. Yes, I admit I was sorely tempted to just reset it back to factory specs and send him out the door. Since Baofeng Tech claims to be the "ONLY" dealer to fix everything Baofeng, I gave him their toll-free number as he was leaving.

Normal programming operation states that if you want to change the programming in a channel you need to delete the current information and program everything again. I also read somewhere (and can't find that again) that the rule only applies, I think, to the receive information. Transmit information can be overwritten. Is that correct or do I have it backwards?

Yes. It happens with different antennas. It's not the antenna connector coming unsoldered from the board. It's not the contacts or pins. It's not mechanical.

Yes. You can update the TX frequency, the T-DCS code and the T-CTCS tone without erasing the memory (that is how you are able to program a repeater). Any other parameter and the memory must be erased and programmed from scratch.

51135. problem scanning in channel mode

Yahoo group: baofeng_uv5r (2015)

I am having a problem scanning in channel mode.

The scan works fine in frequency mode, but when I switch to channel mode and try, I hear “scanning begin”.

I programmed in the weather channel to see if it would stop, but I hear nothing.

Any ideas?

73 N2DYN Angelo

In most Baofeng radios, when channels are manually programmed, they are not put in the "scan list" until the radio is power cycled or otherwise rebooted.

Also, how many channels do you have programmed?

I have 8 channels programmed.

How do I reboot the rig?

From: w8jvf@...
Topic: 51140 Message: 51140

A little off topic, but just letting everyone know that the Hawaii EARC and the KARC will be holding a Field Day this weekend and will be making contacts starting 0700Z 27JUN2015 through 1400Z 28JUN2015.

We are going to be working 40-10Meters, Phone, CW, and possibly RTTY.

If you're looking for Hawaiian contacts to add to your QSO card collection, this weekend may be a good chance for you.

Jim,

That is good info about the newer radios. Do you know what firmware version begins this new programming method? I just ordered another and of course have no idea what firmware I will receive.

FYI to all, Baofeng Tech on Amazon just lowered their price on the BFF8+ from $39 to $28.99 although their web site which now calls it the UV-F8+ still shows it at $39. Also they show the UV5R, UV3R, UV3R+, GT Mk II and others as discontinued and they longer sell them on Amazon.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

And for a little clarification...

You can program a repeater channel by first keying the RX frequency into the VFO and writing it to an empty memory channel. This creates a simplex channel. Then you key in the TX frequency into the VFO and write it to the same channel thus updating the TX frequency to the new value. Do it this way, it is not necessary to setup menu 25 or menu 26.

However, if you do setup menu 25 and menu 26 with the correct values, you can 1) test the setup by accessing the repeater in VFO mode. And 2) instead of keying in the TX frequency, you can display it by tapping the [*] key and putting the radio in 'reverse' mode.

However, the second method may not work right on the very latest radios. This is because the very latest firmware, when writing to an empty channel, will put the VFO frequency into the RX slot and also take menu 25 (SFT-D), menu 26 (OFFSET) and the VFO frequency. do the math to compute the TX frequency and put it in the TX slot all in the same step. So there is no need to put the radio in reverse mode or to do a second write in the very latest radios.

So be careful, some of the traditionally best manual programming guides many not be compatible with the latest firmware.

RDA1846 is the SDR transceiver chip. It can be a N or S depending on
when it was built. I don't know the exact difference between N and S.
RDA5802 is the FM broadcast receiver chip.
24C64 is the EEPROM.
The microprocessor is a supposed to be a Elan EM78P568, but the chips in
both of my radios have no markings so they could have changed. I don't
know how to tell what they are.

Schematic and data sheets for some of the chips are in the Yahoo Group
files area: <https://groups.yahoo.com/neo/groups/baofeng_uv5r/files>

We have all kinds of idiots coming to our table, one guy had a listing of 800 mhz trunked freqs and 6M public service freqs. He just could not understand the radio cannot operate in this range. I got sick of explaining it to him how radios work < I even have pictorial cards explaining this>

Others want CB radio freqs in them, same thing.

I do notice a large number of Baofeng tech products, but since they costs +$20 more than the lowball Amazon specials the real deadbeats will not even buy the more pricey BT radios.

I also give Baofeng’s Tech support number for BT products, I will let them deal with questions concerning their product lines.

Check those freqs when they try to get you to program change stuff, I found one guy with a complete radio reference operational radio someone did for him full of LA County police stuff, full offsets and tones.

Sometimes these people are so blatantly illegal or request illegal things to be done that I actually expect I am on Candid Camera or being pranked. This is why the FCC self-appointed NET Kops have much more to worry about than someone that has a GMRS freq programmed in their radio.

Rich,

Have you also had the folks that come to the booth or store and ask you to read their existing data from the radio, re-sort it some other way, upload the new data file, and then expect that for free as well? Had another one last week with his BF-F8HP (which we don't sell). His friend programmed the radio for him (for free I guess) and he thought everyone that owned one would also do it for free.

Since he refused to pay anything, I reset his radio back to his friend's original template and sent him on his way. Yes, I admit I was sorely tempted to just reset it back to factory specs and send him out the door. Since Baofeng Tech claims to be the "ONLY" dealer to fix everything Baofeng, I gave him their toll-free number as he was leaving.

Jardy

I have had customers and others that did not have any computer skills or very limited skills. Generally, these are people over age 50 that have a tech gap. I have had people bring their computers to one of our shows when we have 10 people in line and expect us to drop everything and fix their driver issues that bought radios from Baofeng tech. They figure they could get free support, similar people when I directed them to Chirp claim that the Chirp exe was a virus and wanted us to fix their computers.

The point is RT systems gets ME off the hook, if the person cannot figure out their radio programming, install, cable and want someone to teach them the whole procedure I just tell them to go buy RT SYSTEMS.

This is especially a good way to politely get rid of those that bought radios from someplace else and models we do not sell or support. The problem though is they expect something for free, a free spare cable, a free program (Chirp) free tech support, free accessories, for their $30 dollar radio they bought.

When we used to do Free Programming for people (when I first started this) I found out I was on the hook every time they deleted a channel, reset their radio, wanted a new location programmed in or wanted us to spend an hour on how the A/B and dual watch worked.

NOW they can call RT systems support for these issues as I cannot handle the amount of calls I was getting from unlicensed buyers of products we never sold to them.

Now if only I can get rid of those trying to pawn stolen or junk stuff to us during our shows and get rid of the yellow-stained underwear wearing goof balls that think they are the FCC and want to do a field spot check at our table, things might be much easier for us.

RT systems was a blessing for us.

Jardy,

If you have 30 different radios you obviously have figured out a way to own them (even at the $12 an hour pay rate you claim), but many of those radios probably use the same Kenwood style programming cable, so your math is flawed, since RT Systems would gladly sell you their software only (no cable) at $25.00 each, thereby cutting your example cost by 50% (15x25=$375, not $750).

RT Systems (a company I can only wish I owned) doesn't price their software based on the cost of the radio being programmed, it's based on the value you receive, so an RT Systems software package for a multi thousand dollar radio (from Kenwood, Icom or Yaesu) costs the same as the software for your Baofeng UV-5R radio. Since it's highly likely that they will probably get far more requests for tech support help from the UV-5R crowd (based on sales numbers alone) vs. those from Icom IC-9100 owners, it's pr obably a safe bet that they make less per package selling the Baofeng software.

My point wasn't that you could not successfully use freeware, it was that freeware isn't really free, as you yourself have invested many hours in both learning Chirp, fixing Chirp, keeping up with bug fixes, etc., etc. To me, time equals money. You may argue that time spent learning and supporting Chirp or VIP is like learning a foreign language, it's an investment. My counter to that is if I could hire someone to speak Mandarin for $25 (the cost of the RT Systems software alone) and be available whenever I needed them (for life), it would really make little sense for me to spend years learning the language, especially if I could also hire (for $25) someone else that could speak Spanish for my next trip.

Yes, the Chirp development folks have invested countless hours themselves in developing and supporting their product as a labor of love, and I understan d that, but you can't deny that their freeware model counts on others to supply them with loaner radios (there are still several models of my Wouxun radios that are either not supported at all, or have very limited support). I'm sure that there are many others I could add as well if I looked.

That lack of capital prevents them from quickly supporting various new radios, or new models of radios (remember how long it took for the 220MHz version of several Baofeng models to be supported)? I currently have on my desk a Wouxun KG-UV8D (that's only partially supported on Chirp, a Wouxun KG-UV9D and a TYT TH-UV8000D (neither of which are supported by Chirp at all), yet all three have RT Systems software available right now.

I went to the NM State Hamfest/Convention last year, showed Rod from RT Systems a 220/440 TYT TH-UVF9 dual-band handheld I was carrying at the time (they had a booth there), and asked him when they planned to support it.&nb sp; He asked me if I would be back tomorrow (Saturday) and then spent time that night working on their TH-UVF9 software product to add 220/440 support. The next day I was able to fully program my radio using their software. Sorry, but without capital, you can't get that level of support (from anybody).

Again, I'm not knocking the Chirp freeware project, and so long as they are willing to work for free, god bless them, but sooner or later they (and their users) will realize that free doesn't pay the bills.

On Wed, Jun 24, 2015 at 12:30 AM, Jardy Dawson JARDY72@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

I have some RT software that was purchased before some of the other choices were available. Yes, it works fine, but on some radios, it just did basics, no other settings. I find it interesting that software and a cable should cost more than a radio. I make $12.00 before taxes and benefits are taken out. Thus, I need to work over 6 hours to pay for a $50.00 item from RT.

I have no problems with my fake Prolific cables, because I have read the FAQs and have checked the Miklor site to know how to fix the problems. I appreciate the endless efforts of those that do CHIRP across such a wide variety of radios, and KC8UNJ for his work on Yaesu and Wouxun radios. I have probably over 30 radios in my collection, probably 15 different makes/models. 15x$50.00=$750.00. And alot of those radios can and do use the same cables.

On Jun 24, 2015, at 00:10, Craig Carnahan craig.n7lb@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

Well, each radio owner is free (no pun intended) to pick whatever version of radio programming software they prefer, but if you seriously think you really "save" money by using freeware, consider this example (and yes, I realize that I'm making some basic assumptions, so modify the model below to fit your individual situation):

365 days per year - 104 days off (52 weekends per year) - 10 more holiday/vacation days leaves 251 "work" days. Figuring most folks take an hour for lunch (or just mess around during the work day for at least 60 minutes per day) leaves a 7 hour work day. So 251 work days x 7 hours per day equals 1,757 work hours per year.

Now here's where it gets tricky, divide your total income by 1,757 hours and you'll arrive at a number that tells you what you make (or did make if your are retired) per hour while at work. My ROI for RT Systems software is less than an hour, your numbe rs may be different.

I would also argue that older folks "should" value what time they have left on earth even more than the young guns, but I realize that not everyone would agree. I prefer to spend my free time on hobbies, family, etc. - not tweaking drivers to make fake cables work, or

trying to figure out why my new radio won't take an older template without more steps.

In the most basic manner possible, I equate time to money, so spending another 15 to 30 minutes one day getting Chirp or VIP working again (on top of the many other times I needed to tweak it) was quickly costing me too much time and effort. So I paid somebody else $48.95 (Amazon and RT Systems) to do the "work" and they handle the various radio issues that crop up, they support me with an 800 toll-free number, plus all of RT Systems Tech Support is based in Denver, CO. I also get lifetime software updates by simply clicking on the software tab.

P lus, if a new radio comes out (like the new 10 watt TYT TH-8000D dual-band or the Wouxun KG-UV9D dual-band), I don't have to wait weeks (or even months) for somebody else to buy one and send it off to the Chirp development team (which I agree does a thankless job). Since RT Systems charges for their product (which I think is worth every penny), they can afford to actually purchase radios and be working on software development before the new radios even hit the streets.

So I agree that if you value the worth of your time at zero cost, Chirp or VIP will always appear less costly (up front), but once you realize that your time is worth "something", RT Systems has a very quick ROI for most people (that take the time to analyze the true cost). In case some folks still feel that their time is worth nothing, please email me off list as I'm sure we can find something you can do for one of the company's I own (no matter where you live) if you are still willing to work for free.

Subject: [baofeng_uv5r] Field Day Contacts!!! Hawaii

A little off topic, but just letting everyone know that the Hawaii EARC and the KARC will be holding a Field Day this weekend and will be making contacts starting 0700Z 27JUN2015 through 1400Z 28JUN2015.

We are going to be working 40-10Meters, Phone, CW, and possibly RTTY.

If you're looking for Hawaiian contacts to add to your QSO card collection, this weekend may be a good chance for you.

Most likely the profit <if any> compared to the number of returns is not worth the hassle for those models. Most USA based entities will not sell them in large quantities- it is not worth it.

Now are those BF F8+ HP versions for $28?

Plenty of tri-power uv5R versions out right now causing a drop in prices for HP models.

Places want to dump them before the firmware becomes too old.

Subject: Re: [baofeng_uv5r] UV-5R - Offset will not store to memory channel.

Jim,

That is good info about the newer radios. Do you know what firmware version begins this new programming method? I just ordered another and of course have no idea what firmware I will receive.

FYI to all, Baofeng Tech on Amazon just lowered their price on the BFF8+ from $39 to $28.99 although their web site which now calls it the UV-F8+ still shows it at $39. Also they show the UV5R, UV3R, UV3R+, GT Mk II and others as discontinued and they longer sell them on Amazon.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

And for a little clarification...

You can program a repeater channel by first keying the RX frequency into the VFO and writing it to an empty memory channel. This creates a simplex channel. Then you key in the TX frequency into the VFO and write it to the same channel thus updating the TX frequency to the new value. Do it this way, it is not necessary to setup menu 25 or menu 26.

However, if you do setup menu 25 and menu 26 with the correct values, you can 1) test the setup by accessing the repeater in VFO mode. And 2) instead of keying in the TX frequency, you can display it by tapping the [*] key and putting the radio in 'reverse' mode.

However, the second method may not work right on the very latest radios. This is because the very latest firmware, when writing to an empty channel, will put the VFO frequency into the RX slot and also take menu 25 (SFT-D), menu 26 (OFFSET) and the VFO frequency. do the math to compute the TX frequency and put it in the TX slot all in the same step. So there is no need to put the radio in reverse mode or to

do a second write in the very latest radios.

So be careful, some of the traditionally best manual programming guides many not be compatible with the latest firmware.

Richard, Unfortunately I won't be able to participate this year. :(I'll be in a class that day.

The club callsign that they'll be using that day should be WH6CZB. 10m should be around 28.420 and 40m should be around 7.180. That's usually the freqs where most of the guys hang out.

If I find out a "calling freq" that they're going to use, I'll post it here.

Good LUCK!

YAYYY .. Happy Dance Time....
In the post this morning, my USB Cable to program the UV 5R.... Even came with a small disk (New Coffee Mug Coaster) ....
Installed the cable, driver not working... DRAT !!! But OK...
MIKLOR Website, Ahaaaaa ... Download compatible driver (Old Build) Install that, retry cable, still not working, ok choose driver to use and BINGO !!! DONE !!!
Now... Download Daily build of Chirp ... and RUN !!! YES !!!
Now Download from Radio.... Plug in cable - Select Com port and press OK. ??? Why does it say Cloning ??? No Matter... and Finished.
So now I have my Radio info on Chirp.. Ohh the Joys !!!!
So now I have my coffee, thinking about Lunch, and thought to myself.. I had better brag in the forums.
The fun part is going to be selecting the frequencies I want to import into the radio (only 128 channels from 0 to 127) But you all know the ISS Frequency is getting programmed in....
Now to get really brave and head out to the Aberdeen Amateur Radio Society's place and get introduced into the Ham Scene and start learning it all.....
Cheers and Beers all round....

One (of several) issues that Baofeng has is the lack of what we in the west would consider real part numbers. I have several identical extended batteries for my UV-5R series radios, all of them have the same Baofeng battery label, some of them have two rows of plastic tabs and others only have the back row of tabs (which allow them to fit correctly for "one-off" models like the UV-5R Plus). If you deal with a local seller, at least you're able to ask them which model(s) of batteries they carry.

I agree with Craig.

I program all of my Baofeng radios, my Wouxun radio and my Kenwood TH-F6a with the same programming cable and driver. The only thing I have to change is the Vendor/Model selection before I begin downloading.

Just note that unlike the Baofeng radios being programmed in "clone" mode, the TH-F6 is programmed in "live" mode. Once the radio is connected to the computer and CHIRP has download from the radio, changes that you make in CHIRP are immediately uploaded to the radio.

Today, I received a 3800 battery from China bought thru Amazon that has only the two tabs.

I spoke with a friend who has the plus and told him I'd found a battery that would fit.

But there's no guarantee what he will receive. If he gets one that won’t fit, I'll offer to swap.

The one with the extra structure should fit my UV-5R and F8-HP.

You need to modify them with a generic smooth tray battery. Use a dremel along the front lip edge. The same generic battery it what is used to modify the TYT F9D versions too.

We have extended ones we sell that we already modified them to fit all the off models. Problem is we sell for $25 each (including tax) which according to customers is $5 more than they see on Amazon (price of the unmodified ones)

Now we just tell them to modify their own batteries and we have to hide the modified versions from the front of the table as we have had someone switch them on us in the past.

Sometimes they will switch bad batteries and broken antennas on us if we are not careful.

Those are the generics and it still will not fit the Uv5R + versions or ones with an extra label character on the model tab. You will need to slightly Dremel the lip between the two vertical lines on the battery itself.

To make it look decent use a semi circle slight carve pattern and hand fit test after each run.

I made a Jig that removes just enough plastic on them to fit without any blemish that shows they were ever modified.

Now you know the joys of Miklor. Just be aware of the eventuality that Windoes Update may overwrite the older driver you had to install to get your cable working with the current one which as you saw doesn't work too well. You would just do the same thing you just did again to restore the old build driver and get you back in business.

Subject: Re: [baofeng_uv5r] Baofeng UV5R plus

One (of several) issues that Baofeng has is the lack of what we in the west would consider real part numbers. I have several identical extended batteries for my UV-5R series radios, all of them have the same Baofeng battery label, some of them have two rows of plastic tabs and others only have the back row of tabs (which allow them to fit correctly for "one-off" models like the UV-5R Plus). If you deal with a local seller, at least you're able to ask them which model(s) of batteries they carry.

Just to be clear, when you have the older, compatible driver installed and working, and Windows comes along and updates to the latest driver, the original driver is NOT OVERWRITTEN. Windows just installs the latest driver and selects it as the driver to use. The previous driver is fully intact and just has to be selected again as shown in step 11 of the guide on miklor.com to restore it as the driver to use.

The attached screen capture is from my computer with 3 different Prolific drivers versions installed. The "trick" is to go into Device Manager and choose the driver THAT YOU WANT TO USE (which in most cases is the Prolific v3.2.0.0 driver because it works with both genuine and unauthorized Prolific type chips).

I keep multiple drivers installed in my computer for a couple of reasons.

1. I switch between the v3.2.0.0 driver and the "latest" driver at will to determine if a programming cable has a "genuine" chip in it or not (if it works with the latest driver without sideaffects - like causing the radio to TX with the cable plugged in) then I assume it is genuine).

2. If the "latest" driver is already installed, Windows isn't going to try to install it again.

And while researching for this reply I noticed there there was a new Prolific driver released this month (v3.6.78.350). So I installed it and immediately reselected the v3.2.0.0 driver (see 2nd attached screen capture)

I am guessing that is a no, as to knowing what the firmware version is where the keyboard programming of repeaters changed?

---In baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

Jim,

That is good info about the newer radios. Do you know what firmware version begins this new programming method? I just ordered another and of course have no idea what firmware I will receive.

FYI to all, Baofeng Tech on Amazon just lowered their price on the BFF8+ from $39 to $28.99 although their web site which now calls it the UV-F8+ still shows it at $39. Also they show the UV5R, UV3R, UV3R+, GT Mk II and others as discontinued and they longer sell them on Amazon.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

And for a little clarification...

You can program a repeater channel by first keying the RX frequency into the VFO and writing it to an empty memory channel. This creates a simplex channel. Then you key in the TX frequency into the VFO and write it to the same channel thus updating the TX frequency to the new value. Do it this way, it is not necessary to setup menu 25 or menu 26.

However, if you do setup menu 25 and menu 26 with the correct values, you can 1) test the setup by accessing the repeater in VFO mode. And 2) instead of keying in the TX frequency, you can display it by tapping the [*] key and putting the radio in 'reverse' mode.

However, the second method may not work right on the very latest radios. This is because the very latest firmware, when writing to an empty channel, will put the VFO frequency into the RX slot and also take menu 25 (SFT-D), menu 26 (OFFSET) and the VFO frequency. do the math to compute the TX frequency and put it in the TX slot all in the same step. So there is no need to put the radio in reverse mode or to do a second write in the very latest radios.

So be careful, some of the traditionally best manual programming guides many not be compatible with the latest firmware.

From: Michael D Earls
Topic: 51177 Message: 51177

In the programming for both my UV-5R and F8-HP, I had the Backlight Timeout under Basic Settings set to 15, since CHIRP shows settings up to 24.

However, after programming, both radios show ABR as OFF.

Is it possible that any setting higher than the radio expects, 1 thru 9, actually turns ABR off.

Has anyone used 10-24 and had it work?

This is because the radio's firmware doesn't support menu 6 (ABR) settings above 10 even though the radio does. If you don't like it showing OFF, then pretend that CHIRP doesn't give you this extended capability and don't program any values above 10. ;-)

That would explain it.

Of course, it was your extremely good "Reference for UV-5R Menus" that indicated it could be set as high as 24.

I appreciate the work you put into it.

Holding down the number button normally no longer shows the actual firmware release, you need to read the actual firmware number by using Chirp (or just use RT Systems).

This is a radio with 3 power levels.

From the CHIRP website home/wiki page:

BF-F8HP (in daily builds)
Also includes the BF-A58
Also includes the BF-F9V2+
Also includes the GT-3TP
Also includes the UV-5RTP
Also includes the UV-5R7W

You need to...

1. be using a recent CHIRP daily build
2. be selecting BF-F8HP as the Model

If the radio model is not listed above, then let me know what it is so
it can be added to the list.

Topic: 51184 Message: 51184

I just bought 2 uv5rs and tried as might to program the HTs with chirp. I've been reading all over the web on solutions, but none had worked. I've tried a friends genuine Baofeng USB programing cable, and some others , even one I made myself. The radio restarts but chirp still reads "cannot read from radio". I made sure that all the plugs were pushed in all the way. I even played around with the port settings with no luck. The radios are different in firmware, one says BFS297, and the other won't display anything.
I can program each radio by hand, but it would be nice to do it via PC.
Oh, and I tried different drivers for USB and serial ports.
Any suggestions?

I have an N5R213 and a N5R2407. If I get a chance I will give them a try and see if it helps narrow it down a bit.

I have noticed some differences in BFS213 and these which are interesting, but nothing important or functional. Things like the low battery warning sequence and KB lock annunciation.

A radio that reports BFS297 firmware is really BFS313 firmware. This firmware version first shipped over a year ago (around May of 2014).

And recently Baofeng made a few radios that apparently missed getting the 14 bytes programmed that contain the radio's firmware version. CHIRP requires this information to be able to determine the capabilities of the radio and to know which CHIRP Radio Image files and other radios it is compatible.

CHIRP should program the 1st radio. But you need to use a recent daily build. Not the v0.4.x stable build. You also have to provide a file and working connection between the radio and your computer. No software work until this is available. The most common issue is that an incompatible device driver is installed. The 2nd most common issue is that the 2-pin plug is not fully plugged into the radio. Both issues are covered on the miklor.com website.

CHIRP will not work this the 2nd radio. You will have to use the OEM software (see the miklor.com website).

51191. Battery Save Function

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-29 23:24:18 UTC
From: cprendon@...
Topic: 1105 Message: 51191

Any idea precisely what the 4 settings other than off do in the Battery Save function. Even the enhanced manual just says that it sets the "Sampling ratio of the Receiver to acknowledge a signal" whatever that means. Default is 3.

In using an external TNC for APRS I have to disable this for it to work, otherwise it cuts off the beginning of packets due to the delay in turning on the radio after a packet begins.

Yes. I measured the time for each setting.
<http://wiki.radioreference.com/index.php/Baofeng_UV-5R#Battery_Saver>
I don't know exactly what the battery saver turns off.

It's the ratio of sleep cycles vs. awake cycles.

I found warnings that using it could cause you to miss a word or two as the radio awakes, so it fits that it could miss data.

Just leave it off.

In testing in a monitor only setup, I found that the stock battery time is about half without the battery saver being on the default of 3. So it does have a benefit, just not for data. Just an FYI

51196. RE: [baofeng_uv5r] TDR-AB disables A/B button

Yahoo group: baofeng_uv5r (2015)
Date: 2015-06-30 16:01:41 UTC
From: Michael D Earls
Topic: 51196 Message: 51196

I have two radios:
UV-5R BFB307
F8-HP FSR3407

The programming and settings are identical except for TX power.

Previously, I had not used TDR-AB.

Currently, both have TDR (menu 7) on and TDR-AB (menu 34) set to B.

The radio's A/B button on the UV-5R does not change displays, but remains on B.

The A/B button on the F8-HP does switch from A to B.

Can someone explain why?

To: baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] channel focus

Hi Christopher,
Unfortunately, the answer is "that depends".
Originally radios would obtain focus on the last signal received if menu 7 (TDR) was ON and menu 34 (TDR-AB) was set to OFF. The user could have focus forced to the top (A) or bottom (B) by setting TDR-AB to A or B.
In newer radios, the TDR-AB behavior has been, shall I say, evolving. The focus no longer changes to the display with the most recent signal reception. The TDR-AB setting automatically tracks the display that is selected when the user uses the {A/B] key. An in some radios, the OFF selection has been removed from TDR-AB. In other words, the TDR-AB functionality has more or less been disabled. [I can see this change for radios with dual [PTT] buttons but I see no reason for it to spill over into radios with a single [PTT] button.]
I hope this helps.

From: larbianchi@...
Topic: 51197 Message: 51197

Hi and thanks for the group.

I have a BF-F9 and want to monitor or prioritize one channel while scanning so if there is activity on that particular channel, the radio will go directly to it. Such as my busiest police channel.

Can this be done? If so, just one channel and how to set the priority.

Thanks for the info.

I don't believe that type of priority scanning can be done with any current Baofeng radio.

It wants to monitor channel 26 which is a repeater and always gets stuck there. Maybe I can try to program the police frequency in its place.

These radios do not have any sort of priority scan. Many people THINK they can set dual watch on then scan on one of the two displays, but when you activate the scan on one display the radio stops checking the frequency in the other display.

The only way to come close to what you want would be to program your priority frequency into alternate channels, such as 0,2,4,6,8,etc with your other frequencies programmed into the other alternate channels 1,3,5,7,etc. This still won't give you a true priority scan because if the radio stops on traffic on one of the non-priority frequencies it will stay there until that traffic ends even if the priority channel has some other traffic.

Generally speaking, these radios do not do well as a substitute for a scanner because the scan rate is much too slow and the functions provided are not nearly as flexible as even a cheap real scanner.

From: n7kuw@...
Topic: 51197 Message: 51202

It will monitor whatever you have programmed into it, and set as part of the scan list. When in use, repeaters are "always on", so when it stops on the repeater it stays there because the carrier doesn't go away.

The easiest cheap solution is to buy another radio and leave it on the channel you are most interested in, and let the other radio scan the rest of the channels.

The best solution is to buy a decent scanner for scanning and use your radio as a radio.

You have a BF-F8HP that has 3 power levels, 1, 5 and 8 watts. It is supposed to be exclusive to Baofeng Tech, a USA based seller of Baofeng/Pofung radios. They to do not carry UV-5R radios.

As far as I know, N5R3409 is the most recent firmware.

Jim

These are being sold and marked as Uv5R’s (back label does show 8W) they come in a Pofung small box.

Strange isn’t it? Since they ARE supposed to be BT use only. I got 5 of them in.

Probably just a mix-up at the factory. The BF-F8HP ships with a 2000
mAh battery. I assume that you got the standard 1800 mAh battery. The
legacy UV-5R case and the BF-F8HP share the same accessories.

Mine does say 8 watt on the back but it came in a Baofeng box.

In a message dated 6/30/2015 7:22:30 P.M. Eastern Daylight Time, baofeng_uv5r@yahoogroups.com writes:

Jim

These are being sold and marked as Uv5R’s (back label does show 8W) they come in a Pofung small box.

Strange isn’t it? Since they ARE supposed to be BT use only. I got 5 of them in.

You have a BF-F8HP that has 3 power levels, 1, 5 and 8 watts. It is supposed to be exclusive to Baofeng Tech, a USA based seller of Baofeng/Pofung radios. They to do not carry UV-5R radios.

As far as I know, N5R3409 is the most recent firmware.

Just like I said in the reply that you included, Baofeng has been changing the way TDR-AB works. They've basically made it useless in the new radios. It works as it should on you UV-5R. It does nothing but track the selected display on your BF-F8HP. Only Baofeng can explain why.

Has anyone had a chance to try this radio out?
I had a 9v2 but it would not power up, put it on a watt meter, and came up 0
I also tried the 5r and it showed 4.9 watts

As Rich and I have stated several times before, any seller (including Baofeng Tech) can get a radio made "for them" for a certain period of time with a large enough order. After that, if Baofeng China wants to make that model available to other seller's, they simply change one or two minor things (like a different case molding or part number) and presto - another "new" radio from Baofeng China.

Baofeng Tech obviously saw this coming when the BF-F9V2+ started shipping months ago, so they asked for a tri-power version of the UV-82, which is now "exclusive" to Baofeng Tech (but for how long, I wonder?). If BT's initial order for the UV-82HP was large enough, they may be able to hold off other UV-82HP clones for six months or so, but I'd be surprised if you don't start seeing UV-82HP clones by Christmas all over the web.

BF-F9V2+This radio is a piece of crap, I bought this radio, and then I could not reach and repeaters, then I finally, got it on a watt meter, and then on all three settings got a big fat 0.did not even have enough power, to get a swr reading.

As Rich and I have stated several times before, any seller (including Baofeng Tech) can get a radio made "for them" for a certain period of time with a large enough order. After that, if Baofeng China wants to make that model available to other seller's, they simply change one or two minor things (like a different case molding or part number) and presto - another "new" radio from Baofeng China.

Baofeng Tech obviously saw this coming when the BF-F9V2+ started shipping months ago, so they asked for a tri-power version of the UV-82, which is now "exclusive" to Baofeng Tech (but for how long, I wonder?). If BT's initial order for the UV-82HP was large enough, they may be able to hold off other UV-82HP clones for six months or so, but I'd be surprised if you don't start seeing UV-82HP clones by Christmas all over the web.

I agree with Rich, if your brand of digital meter is designed to work on VHF and UHF (many are not), and you are seeing 0 watts using a frequency in VFO mode that allows transmit (not a locked, no transmit frequency in Channel Mode like a Weather Channel, for example), then I would return it as well.

Chinese sellers are already looking for the Uv82 HP versions. Not sure what the outcome is but most likely they will be out even sooner from other sources.

It would be nice to see a bigger capacity battery made- you know a real change like double the capacity.

Once I get a report on the uv82HP models (Baofeng employees will sell them on the side too before the contract expires) I will let you know.

I will not sell them as it is hard to sell the Camo versions I have and 220 mhz version at Amazon’s price. Buyers want 4 free batteries a 771 antenna and fully programmed for $40 this is why we do not sell them and I do not really see the HP model being a real big seller either.

However, some nice hybrid digitals coming out and tri banders, these will be good sellers.

Even the A58 waterproof version we cannot sell unless we lowball them under the Amazon prices. Baofeng’s products are perpetually stuck in the under $40 ranges with free accessories just to get rid of them.

Camo colors are available in the original UV-5R, the UV-5R V2+, and the UV-82. What other Baofeng radios were you looking for in Camo?

Yes

Only got those in because You Cannot find a Camo UV82, so thought they would sell quickly. Have 10 of them and maybe 3 left and got them in April. Cannot sell them even AT the normal version price on Amazon including programming, that goes for the 220 mhz version too. Nobody wants them unless at or under $30.

At $30 I am taking a loss so will keep the last 3 camo versions one for display, the other for me and one for my father.

I would imagine the UV82 HP will be a hard sell too if over $60

However, some nice hybrid digitals coming out and tri banders, these will be good sellers. Even the A58 waterproof version we cannot sell unless we lowball them under the Amazon prices. Baofeng’s products are perpetually stuck in the under $40 ranges with free accessories just to get rid of them.

From: mailto:baofeng_uv5r@yahoogroups.com Sent: Tuesday, June 30, 2015 5:17 PMTo: mailto:baofeng_uv5r@yahoogroups.com Subject: Re: [baofeng_uv5r] Radio not what it is? As Rich and I have stated several times before, any seller (including Baofeng Tech) can get a radio made "for them" for a certain period of time with a large enough order. After that, if Baofeng China wants to make that model available to other seller's, they simply change one or two minor things (like a different case molding or part number) and presto - another "new" radio from Baofeng China.

Baofeng Tech obviously saw this coming when the BF-F9V2+ started shipping months ago, so they asked for a tri-power version of the UV-82, which is now "exclusive" to Baofeng Tech (but for how long, I wonder?). If BT's initial order for the UV-82HP was large enough, they may be able to hold off other UV-82HP clones for six months or so, but I'd be surprised if you don't start seeing UV-82HP clones by Christmas all over the web.

Chinese sellers are already looking for the Uv82 HP versions. Not sure what the outcome is but most likely they will be out even sooner from other sources. It would be nice to see a bigger capacity battery made- you know a real change like double the capacity. Once I get a report on the uv82HP models (Baofeng employees will sell them on the side too before the contract expires) I will let you know. I will not sell them as it is hard to sell the Camo versions I have and 220 mhz version at Amazon’s price. Buyers want 4 free batteries a 771 antenna and fully programmed for $40 this is why we do not sell them and I do not really see the HP model being a real big seller either. However, some nice hybrid digitals coming out and tri banders, these will be good sellers. Even the A58 waterproof version we cannot sell unless we lowball them under the Amazon prices. Baofeng’s products are perpetually stuck in the under $40 ranges with free accessories just to get rid of them.

Well, until Baofeng Tech works up a large MOQ order to Baofeng China for camo version BF-F8HP units, you could always mask up the BF-F8HP (or take one apart to avoid the masking process) and spray paint a custom camo design on a BF-F8HP, which would probably be less costly than getting one from BT (if they ever even get Baofeng China to make some). Of course, if you and 499 of your closest friends all want camo versions of BF-F8HP units and are willing to pre-pay, I'm sure somebody at BT would be willing to consider it.

Rich, didn't you used to do some custom camo work on somebody else's radio that was similar to the UV-5R units? Maybe you could offer some pricing on what a custom camo paint job would cost for a one-off unit?

Yes we did customizing on them awhile back with stuff like USMC, or Veteran on them or Call signs. Problem is it took a long time to do and nobody wanted to pay extra for them while they were very time consuming to do. Just a decent acrylic paint set and the templates cost $. In the end we had some cool radios and batteries but was losing too much money and time doing them so stopped

We had some in digital camo and multicam too.

U know I wonder...

409 shop has replacement camo cases for the 5r and camo extended batteries. I wonder if that may be an option.

They also have camo radio condoms for the UV5R, but it only fits the regular battery. The wouxun kg-uv8d also has a camo condom, but again only fits good on the standard battery.

Not a bad idea on the cases, I think, since you could always trim off the bottom on the small case (to allow the extended battery) and then simply purchase an extended camo battery. That modified case "should" fit the BF-F8HP and the BF-F9V2+ units as well.

Rather than trying to paint a camo pattern on one of these radios, you might look at the various vinyl and other sheets, wraps, and skins that are available in most popular camouflage patterns. These became popular in flexible vinyl for use on cars and trucks several years ago -- smaller sheets in thinner material are now popular for use on firearms and accessories such as magazines. The camo wrap to cover a rifle magazine would be about right to cover one of these radios

Jim, Neither of these firmware versions works in the single write mode, N5R2407 being the newest. So it must be somewhere newer than this when the change takes effect.

---In baofeng_uv5r@yahoogroups.com, <cprendon@...> wrote :

I have an N5R213 and a N5R2407. If I get a chance I will give them a try and see if it helps narrow it down a bit.

I have noticed some differences in BFS213 and these which are interesting, but nothing important or functional. Things like the low battery warning sequence and KB lock annunciation.

---In baofeng_uv5r@yahoogroups.com, <rock.unroe@...> wrote :

No. I don't know. Sorry. I believe the radio that I tested it on was a

Subject: Re: [baofeng_uv5r] Re: Radio not what it is? -- Camo

Rather than trying to paint a camo pattern on one of these radios, you might look at the various vinyl and other sheets, wraps, and skins that are available in most popular camouflage patterns. These became popular in flexible vinyl for use on cars and trucks several years ago -- smaller sheets in thinner material are now popular for use on firearms and accessories such as magazines. The camo wrap to cover a rifle magazine would be about right to cover one of these radios

That would also stick out to keep from being switched at the tables or stolen. I have been using the 3800 Red and Yellow batteries on the radios to give high vis so they are not as easily stolen like before.

51247. programming the baofeng bf f-8hp

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-03 07:43:28 UTC
From: frankenotter@...
Topic: 51247 Message: 51247

tuesday afternoon i received a brand new bf f-8hp ht with the idea of getting on the air with a bit more power than my two year old uv 5r. as the 5r took me less than an hour and a half to program, i figured this one would be just as breezy.
good thing i didn't hold my breath.
while the first one was programmed using a laptop with a windows 7 os, this time i'd be using my older windows vista desktop, as my laptop was no more. after four hours of attempts to program the thing, i went to bed.
i woke up the next morning with hopes and anticipation that i would soon be on the air with my new ht.
really a good thing i didn't hold my breath this time.
six hours later, i turned off my computer and turned on the tv.
i had no idea that vista despises the prolific 3.2.2.0 driver. in fact, it despises it so much, it absolutely refused to cooperate with it. it downloaded the program just fine.
vista just thinks that its driver for the ftdi cable is the only one in existence and the prolific driver is a worthless impostor.
so, now i need to find someone who has a windows 7 os.
otherwise my new radio is worthless.

Before I updated the Windows OS to 7 on my desktop, it was using Vista 32-bit Home Basic. I was running the FTDI programming cable and using Chirp Daily Build without an issue.

Now, this desktop is running Windows 7-32 bit and there is still no issue.

Back before I bought the real programming cable, I was using the fake ones and Windows Vista would not run them at all, so I had to use my old Dell B130 laptop that I keep Windows XP on. Ran on XP without an issue.

I just hope your using a real programming cable with the FTDI chip.

Vista is the second-worst product ever released (slightly better than Windows ME). You definitely need Windows 7 or 8 for your computer. I've not tried the 3.2.0.0 driver on 7, but I have on 8.1, and it and Chirp work flawlessly to program my BF-F8HP.

From: jnorton_13@...
Topic: 51255 Message: 51255

I've got a couple of UV-82's already. Me and 2 friends are going on a remote fishing vacation where there is no cell service. We'll have 3 small boats. How would a pair of UV-82's work on a 5 mile long lake? Would a UV-5R also work ok? I'm thinking one radio on each of 3 boats, and one back at the cabin on the beach would be pretty awesome. I have a ham license.

At 5 miles over a lake, should not be a problem, as the water will let the wave skim.
I am not sure how much power it throws out, but should be okay.

While I'm happy to hear you have a ham license the question is do ALL party's have ham licensees and if not, what commercial frequency were you going to use that you have a license to use ? remember frs and gmrs freqs are NOT legal to use with these radios they are at best part 90 and part 95 approved only, range would depend on frequency and antennas used 5 miles handi to handi might be pushing your luck for solid communications.

Just something else to keep in mind, is the area wide open, or is it curved with obstructions of tress/mountains. If so, due to propagation the range may not be enough; especially if you're using a rubber ducky.
If you don't already have, get an aftermarket antenna added with a tiger tail. Another option if you own the boats just mount an antenna to the boat. You definitely should not have any problems with that setup.
Hope it helps.

Yes they work really well over water. I could go from one end of Big Bear lake to the other which is more than 5 miles.

I would suggest getting the extended antenna though and a water proof floatation carry bag for this model $10-15 (yellow version)

USE VHF also unless you are in canyon water areas.

Also for the base station cabin radio, I would get an external antenna like a flex slim jim roll up antenna and hang it as high as you can get. It would not be a bad idea to use a mobile in the cabin that can go further if needed if an emergency hit.

The QYT KT 8900 dual band is cheap enough and seems promising (even with some glitches) to handle this requirement. You might want to even mount one in your main boat

Even though the radios are not Marine band part certified, it might not be a bad idea to put a couple of boat monitor freqs in them including a skywarn

Good ideas there. This is the lake:

https://www.google.com/maps/place/Lac+La+Belle,+Grant,+MI+49950/@47.3757789,-88.0053173,4918m/data=!3m2!1e3!4b1!4m2!3m1!1s0x4d507e2104efb925:0xd2729b21a97799ad https://www.google.com/maps/place/Lac+La+Belle,+Grant,+MI+49950/@47.3757789,-88.0053173,4918m/data=!3m2!1e3!4b1!4m2!3m1!1s0x4d507e2104efb925:0xd2729b21a97799ad

Base station antenna at cabin. Hmmm, I've got a Diamond F22A laying around and 100' of RGF-400. I bet I've got an adapter to use it also. I don't want to get out too far though. There is a repeater about 40 miles away, but it's on 2 meter and I don't want to go there. I've got 2 Nagoya NA-711 antennas. This will work.

I would worry about not being legal, but there's nothing up there. If I'm doing low power GMRS with squelch codes it shouldn't be a problem. About like driving 5 MPH over the limit.

I would stick up the antenna for sure and if you do not need all the cable I would go as short as possible. Also I would use a QYT KT 8900 mini mobile. They can be found under or around $100. For the price and being a dual band these things look promising.

I would not use GMRS even on low power they are not Part 95, and if they were you are on the hook for a GMRS license ($90) I have all three licenses to cover my butt. Plus GMRS is UHF not the best freq for open water range.

GMRS
GROL
Extra class ham

Even I never use the GMRS I still got licensed though, you can get a family license and use a GMRS 5W radio.

II would run Ham radio Simplex on VHF- something not in use in your area for the Boat comms. If you do use the Uv82/uv5 on GMRS I would not tell anyone you are doing this. I would pick something in the middle where the antenna packaging indicates the measured gain levels. This middle freq would give you the best performance in the VHF Ham band

I can't install anything in the boats. 3 of us each got 2 bedroom cabins, with a 14' boats, for $450/wk. We are each bringing our own outboards to put on their boats. So Buttfang hand helds are looking like a great week long temporary communications option. "Joe! We're killing the jumbo perch over here!" is what my goal is. :)

That’s a huge lake! You might want to install licensed Marine radios in the boats instead for emergency and traffic use.

You never know what might happen in the Great Lakes even if you are only going to be max 5 miles out

Good ideas there. This is the lake:

https://www.google.com/maps/place/Lac+La+Belle,+Grant,+MI+49950/@47.3757789,-88.0053173,4918m/data=!3m2!1e3!4b1!4m2!3m1!1s0x4d507e2104efb925:0xd2729b21a97799ad

Base station antenna at cabin. Hmmm, I've got a Diamond F22A laying around and 100' of RGF-400. I bet I've got an adapter to use it also. I don't want to get out too far though. There is a repeater about 40 miles away, but it's on 2 meter and I don't want to go there. I've got 2 Nagoya NA-711 antennas. This will work.

I would worry about not being legal, but there's nothing up there. If I'm doing low power GMRS with squelch codes it shouldn't be a problem. About like driving 5 MPH over the limit.
- Joe

How would a pair of UV-82's work on a 5 mile long lake? Would a UV-5R also work ok? I'm thinking one radio on each of 3 boats, and one back at the cabin on the beach would be pretty awesome. I have a ham license.
>
>
Maybe, maybe not. I've never tried it but simplex to simplex isn't as far as many people think. The higher the antenna(s) the better because of the "radio horizon" problem. The Earth, and even a body of water on the Earth, is not flat. If you try to transmit too far the other radio will be *below* the horizon and you will not have "line of sight".

This is a "radio horizon" calculator.
http://www.qsl.net/w4sat/horizon.htm

Enter in the height of each radio's antenna and it will give you the maximum distance for direct, line of sight, simplex communication. I used 3 ft because I assumed each person would be sitting down in that "small boat" and not standing. It gave me 4 miles.

A person at a cabin on shore would have a higher antenna height.

  It's amazing that some people think things are legal untill it goes over some imaginary threshold like speeding or using a frequency because no one might be listening, a few years back I had a guy argue that because he was using tone squelch that no one could hear anything he said, we was at a campground and he was telling his budy on the radio that he wished some girl wasn't wearing a bikini, he got that idea because he couldn't hear anyone else even tho he could tell the channel was in use he didn't understand that if the tone squelch on the other radio was not enabled he could be heard with no trouble.

First thing, here's the disclaimer, have your buddies all get their ham license. There's quite a few excellent training programs on the web that you can study (the most popular one is like 25.00) then go take your test (15.00 ish) and then your licensed in like a week. It really is that easy to get your tech license.

NOW... AFTER your licensed, you've got a nice little tool to put in your toolkit of life that cost NOTHING to renew every 10 years.

OK... that was the keep it legal speech.

Now if you want to know about propagation over water? VHF carries a LOOONNNGG way over salt water. 50 watts with omni antenna (about 3dBi gain) over salt water has me hitting a repeater on the Big Island, that's 300 miles away. Fresh water will cut it about 2/3. So for real life applications, you're going to find that as long as there's not a huge bunch of crap between you and your buddies, then the UV-82 with the A-V85 stock antenna will work quite well. The UV-5R with that dummy load antenna won't hack it. There are some nice long antennas out there, but I don't think you'll need them, unless you're going for full quieting etc etc etc.

AFter you decide that everyone is going to be legal, take your radios, plug them into CHIRP, and drop that darn squelch setting down to 4's or even 3's for the trip (4,8,12,16, etc etc etc). That way you'll pull weaker signals.

I also use roll-up j-poles a LOT and have found a couple of "quirks" with them. If you have the antenna hanging withing 2 feet of anything conductive (this includes a wet tree) then it's going to throw it off. The best method I've found it to actually shoot a piece of 50lb fishing line up and over two trees, and hang the j-pole in the middle. Yes I use a slingshot and 6-8oz lead fishing weights to do this. I use the monofiliment line because it doesn't snag on the branches as you pull it through. 7-8 feet clearance between the trees works the best IMHO, but I've had OK results with distances as low as 4 feet between the trees.

NOW for the way out there (and I'm SURE I'll get a comment on this), one way you can extend your coverage is if someone is staying in the "middle" or somewhere close to the middle point of the lake, you can string up your J-Pole, run your cable, then hook it to one of those other chinese radios with a built in crossband repeater. Set it to one way, and now you have instant coverage. Since you're going UHF OUT, and VHF IN, and set it to ONE WAY crossband, you'll have a pretty nice comms system out there. Just make sure while your talking to identify the repeater also (This is AB5CDE on AB5CDE repeater). UHF going OUT of the repeater will carry a good 6-7 miles on 5 Watts with no obstructions.

I'm also assuming that you'll have no electricity up there. So charging them up is going to be an issue. Overcome this with either a solar charging station, pack extra batteries, or use AA or AAA battery cases.

Radio is a great tool, if you use it the correct way. One of the reasons Hams get so upset when people use the tools outside of the set regulations, is that if it becomes a problem

then we'll loose the bands. Hence the self policing.

LET THE TROLLING ON CROSSBANDING BEGIN!!!!

The models are new enough, not sure anyone has tried
it. Since you're on boats, wonder if marine band would
work better? Not sure about a marine radio at the base,
but we're all just thinking along, here.

Do the other two fellows have amateur radio license?

Sounds like a chance to test it out, and let us know how
it goes. We can maybe learn from you.

Ah, the ostrich with the head in the sand approach?

I've found that FRS sets with tone squelch, a no tone
radio on the same channel / freq can hear it all.

Some models of Motorola will scan and find both
the active channel and the tone code.

It’s a pity they don’t have a UHF CB band like ours in the US. (5w out and all the antenna gain you can manage – no fee class license)

I live on the shores of Spencer Gulf in South Australia and a lot of the boaties have UHF CB on their boats, since it requires no fees or license, instead of Marine VHF which requires them to pass an examination and pay a ‘once off’ fee. (MROCP).

With 5w on 476/477Mhz they usually get around 10nm range over water, depending on antenna placement, but 5 miles is certainly doable at 5w even with a basic antenna and of course there is a repeater that covers pretty much the whole top section of the Gulf (there’s a marine vhf one as well, but as I said, not all the boaties have a marine radio OCP so they tend to use UHF CB instead – a few still have the 27mhz Marine band radios that are also a class license but they are getting really old now.

I can’t comment specifically on the Baofeng’s range in such circumstances – not to mention that it will depend on the frequency you use, but I concur that a better antenna than the barely functional stock one would be advisable to get decent range and if you are using one at a fixed location, perhaps something external and a bit higher up. 70cm is similar in performance etc to 63cm if using a ham band. 2m would work at least as well, perhaps a little better.

I note the gentleman has a ham license, so presumably his mates do also? Clearly that would be necessary.

Chris,

Marine band is VHF. So yeah. It does work GREAT over water.

Geoff,

Yep I can definitely see you getting about 10nm over salt water. But for some strange reason, fresh water doesn't seem to carry the signal as well. I think it has something to do with ions in the salt water or some such thing.

Joe,

I would like to hear back as to what kind of success you had with the whole thing. There are a couple of antennas I use backpacking/hiking that seem to make a difference in range. If you want the links, just send me an offline message.

Using a transmitter without a licence is not:

Trespassing. Unless you are on land without permission.
Criminal damage. Unless you damage anything.

Theft of the spectrum, perhaps (depending on your definition of theft).

Using a transmitter without a licence will not:

Put you at risk of killing yourself and others.
Put the emergency services to a lot of trouble and expense (of finances
and manpower).

Actually, the analogy is incorrect, but not for the reasons you think.
There is no "licence to speed"; the speed limit is absolute. There is no
absolute prohibition on transmitting; permission depends entirely on
what paperwork one has.

I really don't understand why people have to get so upset over alleged
misuse of frequencies with which they are not concerned. Leave GMRS
monitoring to the GMRS people.

Now, I'm off to tune up on 648 and 6205 ready for tomorrow's simulcast.
(Thinks ... wonder if the UV5 could be converted for wideband?)

Once in a while, some thing actually works well. Most often found by trial and error, and found without government programs.

When I was a kid, my family would go rent a cabin for a week, and Dad and I would do a lot of fishing out of a metal row boat with a gas power motor. Long before cell phones, and a handi talkie to talk back to the cabin would have been useful.

I'm curious how things go for the OP. If the Baofengs make the distance, and if two meter or 70 cm does better.

Agreed. It's just a $30 radio that works well for what it costs. At that price it can't be all things to all people, you'll have to spend a lot more.

It is a good little radio to use for simple handi-talkie uses, erecting an antenna with friends, a club providing support for a 10k race (or as we do here, a 150 mile canoe and kayak race), a family camping, or similar activities. If you need GPS, cross band, etc, you'll need to spend more money.

One thing probably overlooked... for the experimenters among us, the UV-5R can provide the basis, and quite cheaply, for other activities. Transmitter for a foxhunt, or tracking a balloon, as a university does here every year. If it's lost you haven't also lost a $400 radio.

I have three UV-5Rs which I pass out for club activities. If one were dropped and broken, lost, stolen off a table at a public event, I would not be all ticked off over it.

It's the Bic pen of handi-talkies... and the Bic pen writes well.

If memory serves, a transponder is a self contained
device that takes one signal, and changes it to another.

For example, a chip in a credit card (some types of)
takes a RF signal, and changes it to another signal.
RFID chips are like this, transponders. Handi talkies
are not transponders.

As to Baofengs, I've heard that some people have
wired two HT with each other. Signal comes in one
set, and is retransmitted (on other band) on other
HT.

The guy on the five mile lake could find this useful,
put the two HT on a high point, maybe up a tree,
and make it possible to talk farther. Some what
similar to a repeater.

Subject: Re: [baofeng_uv5r] work like a trasponder or not ?

If memory serves, a transponder is a self contained
device that takes one signal, and changes it to another.

For example, a chip in a credit card (some types of)
takes a RF signal, and changes it to another signal.
RFID chips are like this, transponders.

Mmm, close, RFID chips are simply very low powered transmitters, with a coded id. When they pick up the signal from the interrogator, it simply uses that RF energy to generate a DC voltage that powers the chip and it’s tiny TX just long enough to send the id code on a different frequency. The interrogating signal is not otherwise used or even processed, it’s simply a remote power supply, so technically it’s not a transponder as such.

Handi talkies
are not transponders.

Indeed not. Best example of a transponder is the radar transponder used in aircraft, it picks up the transmitted pulse from the primary ATC radar and in response, transmits a signal that carries encoded information about the aircraft, usually groundspeed and altitude (mode c) and it can be assigned a specific individual code to identify the aircraft on ATC radar. Because it sends a signal of its own instead of just the reflected signal from the primary radar, it dramatically increases the range of the radar system.

DME or distance measuring equipment in aircraft also uses a transponder, which transmits a signal to a ground station, which returns it to the aircraft, which then measures the phase difference – this allows a distance calculation to be made.

As to Baofengs, I've heard that some people have
wired two HT with each other. Signal comes in one
set, and is retransmitted (on other band) on other
HT.

Yeah, that’s been done with many radios, Motorola’s were a favourite for this at one time.

The guy on the five mile lake could find this useful,
put the two HT on a high point, maybe up a tree,
and make it possible to talk farther. Some what
similar to a repeater.

It is a repeater, a crossband repeater. Sometimes called a ‘translator’. When I worked in commercial TV our master station had several ‘translators’ to provide local coverage, most of them simply picking the signal up off air, cleaning it up a little (proc amp and such to

clean up the syncs and so on) and retransmitted it on a local frequency, some of which were UHF.

I remember when my son-in-law's parents were over from France. His father made the comment that the "wild" strawberries in our back yard were "ferocious" strawberries. I'd say a similar thing is happening here with the Italian to English translation.

Not by itself. Rather than use 2 Baofengs and an interface box, use one radio that works by itself like a Wouxun or Puxing. A lot easier that way

You can set up a Boafeng to listen on one band and transmit on another, but it won't take someone else's signal and do that.

There is a small repeater interface box with leads for the speaker/mic plugs on Ebay. just enter: "repeater interface for baofeng" in the search. be sure to follow the instructions in the package.

2 radios, wiring, and interface box (bulky) compared to 1 ht (nice and compact), all for about same price.

51301. BFF8+ any good?

Yahoo group: baofeng_uv5r (2015)

Hello,

I've had a UV5R for the last couple of years, and while it was working it worked fine. First thing that went out was the on-board mic. Since I mostly use an external Kenwood mic, this was not as much of an issue for me. But since last fall my UV5R has had issues transmitting. It works for a few minutes, and then after that it will only transmit a carrier w/out any modulation. I still think I got my $45's worth out of it.

Now I'm looking to replace it. I was looking at the BF-F8+ as from what I understand, it will accept all my accessories (including extended battery) from my UV5R.

Does anyone have any experience with this model? Any known issues? Any other suggestions (keeping in mind the compatibility of the accessories)?

I bought my original UV5R at 409Shop, so I will probably get the new radio there too.

It will be 100% compatible. The difference that you will notice is the inverted display. I've never had a radio with the inverted display, yet. I don't know if I would like it. I know that some really do. If you want a radio that is 100% compatible with your accessories and has the traditional LCD display, take a look at the BF-F8HP.

Yep.. The BF-F8+ is 100% compatible with the UV-5R accessories. I really like the inverted display. It is actually easier for me to read without my glasses than the regular display.

Jim has a point though, IMHO the BF-F8HP is a little nicer radio. I use mine about 90% of the time on 5watts. If needed for that little extra kick, it puts out a good 7.6 watts. I've had it actually kick out 8.4watts when my battery read above 8.1volts.

Yes james, I too like my BF-F8HP BETTER. I use the UV5R battery eliminator while mobile in the car and I also get 8.4wts. is why I can not see giviving them $139 for their 10w mobile. it just isnKt worth the less than 2wts difference.

Or the tri-power uv5R TP

or the Zastone 8W ZT 8W HP model

Couple of good versions now with 8W

OR you could spend a little more and get the TYT F9D triband 7W, 3 bands, voice scrambler and compandor and all the uv5R accessories fit

You need to modify the 3800 batteries slightly (Dremel)

and the AA battery clam packs slightly to fit

Rest all fits and the TYT allows manual Alpha tag changes (no puter needed) and all batteries are charged via 12-13.8 car socket. The optional drop base can charge u55R batteries and the 1800 batteries can interchange.

The TYT F9D version at least the one I got (reverse display) the accessories can interchange except SMA M antenna

1 3800 Battery pack needs end corners rounded on generics to fit (takes 3 min)

2. 3800 AA battery pack needs a small dremel in two edge places to fit (takes 30 seconds)

Of course the radio body can be slightly rounded to fit the batteries so the batteries do not need modified

The TYT charger (regulated version wall AC) can be used to charge the 3800 batteries in the side socket interface

The TYT charger base can be used for the uv5R directly to a solar panel or a car accessory socket

All 1800 ma uv5R batteries will fit

The people buying the Tri band versions are Government such as the US Army reserves

I do have a nice PRC 152 Falcon III and was playing with a PRC 117G this 4th of July

Or the tri-power uv5R TP

or the Zastone 8W ZT 8W HP model

Couple of good versions now with 8W

OR you could spend a little more and get the TYT F9D triband 7W, 3 bands, voice scrambler and compandor and all the uv5R accessories fit

You need to modify the 3800 batteries slightly (Dremel)

and the AA battery clam packs slightly to fit

Rest all fits and the TYT allows manual Alpha tag changes (no puter needed) and all batteries are charged via 12-13.8 car socket. The optional drop base can charge u55R batteries and the 1800 batteries can interchange.

For the money, get The BF-F8HP. all UV5R ass fit. it is basicly a 8w UV5R. just when ising chirp to program is the only difference as it is 1-5-8wts.

Try using a cotton swab and triming it to fit the mic (larger) hole use ISOPROPANOL Alcohol it might have crud on the contacts- see if this works

Subject: [baofeng_uv5r] BFF8+ any good?

Hello,

I've had a UV5R for the last couple of years, and while it was working it worked fine. First thing that went out was the on-board mic. Since I mostly use an external Kenwood mic, this was not as much of an issue for me. But since last fall my UV5R has had issues transmitting. It works for a few minutes, and then after that it will only transmit a carrier w/out any modulation. I still think I got my $45's worth out of it.

Now I'm looking to replace it. I was looking at the BF-F8+ as from what I understand, it will accept all my accessories (including extended battery) from my UV5R.

Does anyone have any experience with this model? Any known issues? Any other suggestions (keeping in mind the compatibility of the accessories)?

I bought my original UV5R at 409Shop, so I will probably get the new radio there too.

Being that we already carry Icom, Motorola and Relm on the government side of the house, I haven't had any opportunity to play with the Harris manpack stuff, but I have to admit it certainly looks cool enough to want to play with.

Thank you everyone. It confirms that the BFF8+ is compatible, and seems reliable.
I'm concerned that the HP model might be too new, and maybe unknown issues.
The BF-F8HP is nice, but unless someone has a reputable (HK) seller, I'll have to skip.
409Shop doesn't carry them. I'm not willing to buy from US when they ask $45-60 shipping to Canada. It's ridiculous. The shipping is more than the radio itself. 409Shop ships for free to Canada.

Also, I have a Daiwa LA2035R VHF portable amp I used with my UV5R, so if I need power I just use that.

I think I will go with the BF-F8+.

Another advantage the Chinese vendors have is the ability to use China Post for mailing world-wide, which is heavily subsidized by the Chinese government to encourage export shipments (which is smart). Sadly, no one within the U.S. government (this administration or previous ones) is smart enough to understand how many small sales end up creating an economic onslaught that is now China.

Yep... I remember that review. In fact that review is what made me buy my original one. After running over that one with the car (long story), I purchased a replacement which I still use a LOT.

I'm going to try and see if the inverted display will work in it, as well as replacing the 0.5W speaker with a 1.0W speaker. I need to replace the number pad anyway, so I figured while I had it open I'd experiment.

Also, the replacement (it's only about 6 months old) really cranks out the 8.4 watts when I have the battery fully charged. It's almost like a direct correlation to the voltage of the battery with the watts. 8.4Volts=8.4watts, 7.6volts=7.4watts, etc etc etc...

The UV-5RTP is available from RadiOddity dot com.

I've had pretty good luck with them.

So you originally got the BFF8HP, and then bought the 5RTP?
I wish you would expand on the 'long story' :-)

Is the UV5RTP == BF-F8HP? I notice it has the band button still there.

Does the 5RTP also have the battery voltage display (press/hold '0' on keypad)?

Thank you for the link to Radioddity. The 5RTP is only $8 more than the BFF8+. Not sure which one to get now.

Or customs charges.

I had a $82 Customs duties charge my last order and it was for only 12 radios.

Shipping by DHL is not free either usually over $100 each order

We have an 8.9% tax rate here

This all adds up and ends up with a final price way over $30 which is what most want to pay for a generic uv5R

BF F8 + HP is made only for Baofeng tech. You have to sell your own model that can easily be identified that it is indeed from you and has some differences to justify an increase in price to actually end up with a profit.

If not you end up with people trying to return bad radios not bought from you. Labels can be peeled and switched, we have had it done to us, case styles are more easier to ID quickly- so your create a new case style that only you sell like the BF F8+ HP . Some of the more trickier types have tried to switch case on us though, they would actually take the radio apart and swap cases to get a free exchange, Too bad for them the message we place on the radios indicated it was not from us including Firmware.

$45 for shipping sounds really high, should be something less than that though. I can see NO difference in power or capabilities between the BT BF F8 HP and the uv5R TP now except the case style and stock battery claims + packaging. I think once we sent 10 radios to be used on a Hollywood movie set on a Part 90 registered freq and was only $60 shipping for those 10. Check around for a possible better shipper.

After the paid HP contract time expired everything is getting or can get the HP upgrades tri-power versions in. I would imagine in a few months it will be the same for the Uv82 HP

Yes, I agree Rich. Since most (all?) of the Chinese factories want payment up front before shipment, won't ship product unless using air freight which also raises the cost per radio (the factories seem to hate China Post or aren't allowed to use it), and the hit (after the fact) with custom's charges (none of which the end-user cares about), it's difficult to see most U.S. or Canadian dealers selling the Baofeng product line, since end-users see the non Part 90 stuff all over the internet from various Chinese sites for around $30 to $40.

I had a customer drop off a Baofeng UV-F8+ this morning and the white on black display was so dim I could hardly read it, but he thinks Amazon rocks, so not much use of discussing his radio's non Part 90 status. We just programmed it for him, collected his money, and sent him on his way.

Thanks John,

I tried that site link for the image files several times in the last few hours, but I keep getting an error. Not sure what the problem is there.

I found a N5R2401 image file in the files section here that appears to have worked to reset the receive audio/squelch. I can hear again.....

Ernie,

Must be something on your end because I was able to download the image
that you were looking for without any problem.

Yes. To recover a radio that had an incompatible image uploaded into
it, all you really need is a N5R image if it is an N5R radio or a BFB
image if it is a BFB radio. It is the "main" memory that gets messes
up and caused the radio to not receive.

You only need and exact match when you are trying to put your radio
back to "factory".

Marc,

Long story short... Running power lead through car, car on ramp jacks, didn't take radio off hip, rolled car off ramp jacks right onto saoid radio lying on ground. And yes, there may have been some beer involved.

The 5RTP has identical function /menu to the F8HP. So everything is the same. The differences is in the low gain mice which is standard in the 5R's, a LOT better antenna, different faceplate, and in the speaker quality of sound. Personally my F8HP "sounds" a little better.

Both use all the same accessories, programming software, etc etc etc.

I just like the looks, feel, sound of the F8HP. Not really a technical issue for me, it really is subjective.

But the thing is, you don't have to upgrade anything on the BF-F8HP. I use the stock antenna that comes with it because it is durable and it works well. The stock antenna that comes with the 5RTP is nothing more than a dummy load.

I noticed that on Amazon the UV5RTP has the following added to the description: NOTE: The frequncy of the UV-5RTP radio has been set as 140-150/430-440MHz when it manufactured. In order to use the 136-174/400-520MHz, you need to do the factory reset. Press the Menu button, type '40', and then the radio will be reset. Then, please use the the Baofeng official software (Not CHIRP) for programming. It has the page under "other" simply checking the box that says "allow more than 480mhz transmit", and changing the frequency range from 400-520mhz, then click write to radio.

If not you end up with people trying to return bad radios not bought from you. Labels can be peeled and switched, we have had it done to us, case styles are more easier to ID quickly- so your create a new case style that only you sell like the BF F8+ HP . Some of the more trickier types have tried to switch case on us though, they would actually take the radio apart and swap cases to get a free exchange, Too bad for them the message we place on the radios indicated it was not from us including Firmware.

$45 for shipping sounds really high, should be something less than that though. I can see NO difference in power or capabilities between the BT BF F8 HP and the uv5R TP now except the case style and stock battery claims + packaging. I think once we sent 10 radios to be used on a Hollywood movie set on a Part 90 registered freq and was only $60 shipping for those 10. Check around for a possible better shipper.

After the paid HP contract time expired everything is getting or can get the HP upgrades tri-power versions in. I would imagine in a few months it will be the same for the Uv82 HP

Thank you everyone. It confirms that the BFF8+ is compatible, and seems reliable.
I'm concerned that the HP model might be too new, and maybe unknown issues.
The BF-F8HP is nice, but unless someone has a reputable (HK) seller, I'll have to skip.
409Shop doesn't carry them. I'm not willing to buy from US when they ask $45-60 shipping to Canada. It's ridiculous. The shipping is more than the radio itself. 409Shop ships for free to Canada.

Also, I have a Daiwa LA2035R VHF portable amp I used with my UV5R, so if I need power I just use that.

I think I will go with the BF-F8+.

As far as the BF-F8HP being to new, no.
The ones on the market now are over a year old and are the second "fixed" firm ware version. I have 3 and have had no problems from either.
I did jump the gun and baught one of thefirst run. failed sent Iit back and while in transit, Amazon pulled all BF-F8HP from sales and put a hold on all orders until Baofeng fixed and sent new ones because of the return rate of said run. so the BF-F8HP is now glitch free

I noticed that on Amazon the UV5RTP has the following added to the description: NOTE: The frequncy of the UV-5RTP radio has
been set as 140-150/430-440MHz when it manufactured. In order to use the
136-174/400-520MHz, you need to do the factory reset. Press the Menu
button, type '40', and then the radio will be reset. Then, please use
the the Baofeng official software (Not CHIRP) for programming. It has
the page under "other" simply checking the box that says "allow more
than 480mhz transmit", and changing the frequency range from 400-520mhz,
then click write to radio.

Thank you James. I guess I would be better with a F8HP, but the 5RTP from RadiOddity will have to do unless I can find another (trustworthy) HK seller. I already use an external mic, so I can buy another antenna if that's the big difference.

Marc, VE2EVN

---In baofeng_uv5r@yahoogroups.com, <w8jvf@...> wrote :

Marc,

Long story short... Running power lead through car, car on ramp jacks, didn't take radio off hip, rolled car off ramp jacks right onto saoid radio lying on ground. And yes, there may have been some beer involved.

The 5RTP has identical function /menu to the F8HP. So everything is the same. The differences is in the low gain mice which is standard in the 5R's, a LOT better antenna, different faceplate, and in the speaker quality of sound. Personally my F8HP "sounds" a little better.

Both use all the same accessories, programming software, etc etc etc.

I just like the looks, feel, sound of the F8HP. Not really a technical issue for me, it really is subjective.

But the thing is, you don't have to upgrade anything on the BF-F8HP. I use the stock antenna that comes with it because it is durable and it works well. The stock antenna that comes with the 5RTP is nothing more than a dummy load.

Yep... Antenna is as important as the radio. If you order the 5rtp from RadiOddity, get the A-V85 antenna also. Then you'll basically have a BF-F8HP.

This is most likely put here as a liability reason. I get a large amount of radios bought from other sources that came with factory freqs in the Police/Fire bands and people just run those because they are unlicensed.

So they put a limit on what is coming out of the factory (per sellers request) to limit some of the ability to use freq mode and dial in freqs way out of band or to run the test freqs.

Don't forget that the 771 is literally a whip. About 15" (38cm) long so very unwieldy on the hip if you wear your radio or pack it in anything. I have found that the better of the many versions is the one with the gloss cylindrical base with the blue silk screen print. Miklor did some extensive testing of antennas which bears this out. Check the link under Field Testing.

The Diamond SRJF40A is a fantastic antenna if you want a flexible. The flex feature lets you virtually fold it in half when you need it to be compact and then fold it out for a full power antenna. It's only fault is that it is VERY flexible which means if you move the radio even a little quickly if bends over. Might be too flexible for some.

Hi Mike,Can't keep up wit you guys :-)
I still use the stock antenna wit my UV5R and indoors I use a slim jim antenna that gets good range.
For mobile use I use a 5/8th for 2 meters but I measured it and it can also be used for 6 meters.
I would guess running off the car battery the HT is over 5 watts since the voltage is 14.2 volts.
I never measured it but so far no problems with the HT.
Darn things are so cheap I can't stop buying them :-)
You guys know these China HT's better then the people who make them.
I enjoy reading the post.

My UV-5r doesn't receive with the roof magnet mount
antenna, if I'm any where near power wires. As such, I
may have wasted money on long hand held antennas.
Sadly, that's a design flaw.

As such, I regret the couple of long HT antennas I've
purchased.

Back in my CB days, a CB handi talkie on a mag mount
or roof antenna did much better. Yesterday's solutions will
be applied to today's problems even if they are no longer
appropriate.

On simplex mobile to mobile using the same antenna,we were able to hold a
QSO for 14 miles.
Check the SWR and try to borrow a FS meter.
Your RF is getting lost some place so it just a matter of tracking it down
and try making a 1/4 wave mag mount and see what happens.

I'm lost on your problem.
You can transmit and receive with the stock duck antenna but cannot receive with any other antenna.
Any other member have that problem?
If it's working with the duck antenna the RX has to be OK.

I'm lost on your problem.You can transmit and receive with the stock duck antenna but cannot receive with any other antenna.Any other member have that problem?If it's working with the duck antenna the RX has to be OK.BOB AF2Q In a message dated 7/8/2015 4:59:35 P.M. Pacific Daylight Time, baofeng_uv5r@yahoogroups.com writes:
Sadly, I don't have a SWR meter. Nor field strength. As
such, it's just wing it and see what works. So far, the
rubber ducky antenna has worked best, even inside
the vehicle.

As I understand, the Baofeng have a receiver problem,
which has little to do with RF gettign lost. I don't think.
Maybe?

I have the BNC version (have adapters on all of my HTs) and it is an nice antenna. Can just about wrap it around the HT lengthwise and stick it in your pocket. I also agree it could be a little "stiffer" but I learned not to move fast. :-)

These radios require 7.4 volts to operate. They cannot operate at 14.2 volts. If you supply them with much over 8.5 volts (as with an AA-cell pack with 6 alkaline cells (6 x 1.5 = 9 volts)) the radio will receive but TX is disabled.

I thought the car cable powers the charger base. The wall
wart that came with my BF says 10.0 volts DC, a running
car at 13.6 might be a bit much.

I'm told not to leave the HT turned on while charging. It
fakes out the circuit, and damages the batteries.

Like I mentioned earlier, I do SOTA (Summits On The Air) which is going up mountains to take advantage of the higher altitude and get crazy range.. like 100miles with 5w on a whip.
Overload isn't normally a problem. If it is, then I just switch to a "worst" antenna.
I use a "Stubby" in the city which works well for repeaters. Works better on UHF than VHF, not surprisingly.

I just want more range as a backup when hiking. I prefer using my home-built portable Yagi on 2m from mountain top, but in winter it would be nice to have something easier to use and to carry.

That sounds good. I'd dare to guess with the mountains, there
are fewer power wires, and over loading sources of RFI.

The one time I tried a roof mount (at an industrial complex),
wished I'd not. Might have had more success to go back to
the rubber ducky. About that moment, one of the guys
loaned me a mobile set with a lighter plug and real magnet
mount antenna. Gives me reason to save my pennies, and
buy one some day.

Yes and No. Some summits have commercial VHF/UHF towers on them. Those cause a lot of overload. You just have to walk away from them and try again, while still on the summit. It's definitely harder with a Baofeng than with a Yaesu FT-60R.

Hey Jim Thanks it was actually Avast not Norton, but I just wanted to be sure it was safe =)

I probably should have check this radio out more thoroughly after I bought it a few months ago. I really like my Yaesu and Icom Handhelds and always just grab one of those when I go out. I programmed this UV5R+ the other day by first downloading the settings into Chirp then uploading the new channel settings I wanted just like I do on all my other handhelds. I noticed though, this UV5R+ rig was not receiving, but it transmits fine. I'm beginning to wonder if maybe it never received from the beginning even before I programmed it, maybe it was someones return that screwed up the programming before I received it since this is my only Chinese rig, so I wouldn't have crossed the programming images on the upload =)

Anyway, after reading everyone's comments on the UV5R not receiving, I checked menu 8 and the (Beep) setting is ON and the R-CTCSS is OFF. So I thought maybe I would try to reprogram it back to the default factory image. In my current image the FW string 1 says N5R-219 AND FW string 2 says BFB297, when I hold down 3 and turn on the Radio it says BFB297. Anyway I downloaded the N5R-219(factory).img, but Chirp 2013 0.4.1V and even the latest release says the image not supported by Radio. So downloaded the BFB297(Factory).img and that one loaded up fine, but at the end of the upload it errors out saying it can't load the original settings because it doesn't match that of the radio N5R-219BFB297. Anyway, after loading this image up even with the error, the rig still doesn't receive unless I push and hold the MON button down, then it receives fine.

Does anyone else have any ideas on what else I can do/check or maybe why the N5R-219(factory).img file won't load? I would really appreciated it. I don't know that much about these Chinese radios, but I'm hoping someone else does =)

Mike,

If it's the charger that's kind-of shaped like a number 7 then that's the one I have that works extremely well. They normally ship one in each TH-UVF9 box (which is how I got mine), but that same charger works for the Baofeng 3800 mAh battery as well.

Interesting. The specs and wording indicate a battery eliminator, yet the picture shows the cigarette lighter instead. If what you got is the cigarette lighter (as shown in the picture), that's the one I have.

I didn't know people did SOTA with VHF!!! THAT'S AWSOME!!!!

But I got to thinking, if you want a lot of bang, and if there's some trees around... have you thought about stringing a roll up J-pole? If you're doing just VHF you won't need to do the Ed Fong version, just a straight VHF J-Pole. With the added length you'll get some good capture to pull in those weak signals.

Just a thought, now you got me thinking about hiking up to the top of Diamond Head and seeing what I can do!

Subject: Re: [baofeng_uv5r] Re: BFF8+ any good? (ANTENNA)

These radios require 7.4 volts to operate. They cannot operate at 14.2

volts. If you supply them with much over 8.5 volts (as with an AA-cell

pack with 6 alkaline cells (6 x 1.5 = 9 volts)) the radio will receive

but TX is disabled.

51370. Low range in 2m band

Yahoo group: baofeng_uv5r (2015)

From: nt-server@...
Topic: 51370 Message: 51370

Hi all,

we tested the tx range with a Diamond X-200N antenna. In 70cm band we had a range approx. 12km. In 2m band the range test was very bad (approx. 1km). What could be the reason for this difference?

Lol, Yes, SOTA on VHF. Pretty much everyone does as a backup in case of poor HF conditions. I have a roll-up J-Pole. I've used it with an Icom HT with success, but not with the Baofeng. I think it's too much signal for it. I guess it depends on which summit, and if there are any RFI sources in the area.

But you mentioned something.. many summits don't have any trees at the top, so that's where my Yagi is more useful.

Do hike and make contacts. It's great fun. If you're on Facebook, join the SOTA group (https://www.facebook.com/groups/37631909313/)

Marc, VE2EVN

---In baofeng_uv5r@yahoogroups.com, <w8jvf@...> wrote :

I didn't know people did SOTA with VHF!!! THAT'S AWSOME!!!!

But I got to thinking, if you want a lot of bang, and if there's some trees around... have you thought about stringing a roll up J-pole? If you're doing just VHF you won't need to do the Ed Fong version, just a straight VHF J-Pole. With the added length you'll get some good capture to pull in those weak signals.

Just a thought, now you got me thinking about hiking up to the top of Diamond Head and seeing what I can do!

#1 Watts out - do you have a wattmeter to see what you're transmitting? You sure you're on high power on both bands?

#2 SWR - could be an SWR mismatch for some odd reason - can you watch SWR?

#3 Connectors - could be a bad connection only affecting 2m - an antenna analyzer would help there.

I found an adjustable-voltage cigarette-lighter charger at Walmart. It comes with 7 different barrel tips and a USB port. The voltage adjusts to: 3V, 4.5V, 9V, or 12V DC @ 2000mAh

It's available online for $16 plus shipping.
http://www.walmart.com/ip/PowerLine-2000-mAh-Car-Cord-Adapter/17134646
http://www.walmart.com/ip/PowerLine-2000-mAh-Car-Cord-Adapter/17134646

I also found a MW-282 DC-DC car converter--less than $10--but it's backordered.
http://www.mcmelectronics.com/product/29-6305
http://www.mcmelectronics.com/product/29-6305

Both work well for charging HT batteries by using them with the regular charging base. The difference between 11v and 12v doesn't seem to cause problems with the charing base.

BTW: A alternator/battery may be as high as 14.4 volts.

51374. Road trip VHF vs. UHF

Yahoo group: baofeng_uv5r (2015)

Next week I'm planning to go on a road trip with friends. I have Baofeng UV-5R and GT-3 Mk II. I do not have car antenna. Because my friend those not know anything about radio I was planning to set it up on one channel low power for him. But I'm not sure to go VHF or UHF. What do you think is better way to go?

Best regards,
9A3AYY.

When I took my radio course, they said that UHF has
smaller wave length, and does better at penetrating
buildings and urban items. Pehaps cars are the same
way?

The obvious is true, a practical test before the trip is
a wise idea. One time I tried FRS with a woman,
but could not hear her at all. Find out later she was
holding the HT about a foot away and with the mic
pointed to the floor.

Another time, boy about 7 would talk into the speaker.
I traded sets and tried different talk points. I showed
him how to talk into the mic. His reply "oh, I do it like
this.... " and showed me how he talked into the speaker
(this, I knew) so I could not hear him.

Another time on CB, the other car could only hear me if
I was within about 100 yards. This is consistent with
ignorant someone who maxes up the squelch.

Please consider some practical testing, so you
have effective radio comms.

From: w7fj@...
Topic: 51338 Message: 51377

I guess no one here knows the answer to my question =) Does someone at least know where I can get old version of Chirp that will allow me force load the N5R-219(factory).img into my UV5R+. I only see 2 versions available on the website and they both won't allow my radio to be flashed with the image on kc9hi's site. Maybe there is no way to go back past Chirp 0.4.1, not sure. The N5R-29 is the FW for this radio, so I don't know why the software is being so picky about it. Can someone shed some light on this issue possibly?

Tnx,
Rob

Interesting. The specs and wording indicate a battery eliminator, yet the picture shows the cigarette lighter instead. If what you got is the cigarette lighter (as shown in the picture), that's the one I have.

Mike,

If it's the charger that's kind-of shaped like a number 7 then that's the one I have that works extremely well. They normally ship one in each TH-UVF9 box (which is how I got mine), but that same charger works for the Baofeng 3800 mAh battery as well.

In addition you will get more multi-pathing on UHF in the form of more crackle. It is better when you are stationary and in a building. VHF is quieter when you are on the move.

Subject: Re: [baofeng_uv5r] Road trip VHF vs. UHF

When I took my radio course, they said that UHF has
smaller wave length, and does better at penetrating
buildings and urban items. Pehaps cars are the same
way?

The obvious is true, a practical test before the trip is
a wise idea. One time I tried FRS with a woman,
but could not hear her at all. Find out later she was
holding the HT about a foot away and with the mic
pointed to the floor.

Another time, boy about 7 would talk into the speaker.
I traded sets and tried different talk points. I showed
him how to talk into the mic. His reply "oh, I do it like
this.... " and showed me how he talked into the speaker
(this, I knew) so I could not hear him.

Another time on CB, the other car could only hear me if
I was within about 100 yards. This is consistent with
ignorant someone who maxes up the squelch.

Please consider some practical testing, so you
have effective radio comms.

9 volts is too low. 12 volts is on the high side and may be OK if it
is adequately regulated. A straight though cable with no regulation is
a bad idea unless you are using the TYT BCG-F8 charging cradle.

I got the 10 volt output power cable from 409shop.com for $7.50.

51391. Connect Baofeng into race car

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-09 21:36:56 UTC
From: jchuillier@...
Topic: 51391 Message: 51391

Hello all,

I have 4 UV-B5 models which I would like to connect into a racecar. 1 radio stays in the car and is used by the driver to talk to the "pit" radios, on the steering wheel there is a button which I use to connect both grounds (mic and spk) together on the radio to switch it into tx mode.

I know they are not UV-5R but my problem is not model dependant.

I have made a "car loom" which plugs into the speaker/mic plug of the Baofeng, then isolates the 2 grounds (spk and mic) to go to the steering wheel button to activate the tx mode from the steering wheel.

The loom then goes to the driver's helmet using a "peltor" compatible plug with 4 wires (spk+ spk- mic+ and mic-), when I plug the radio and not the helmet and power it on I can use the steering wheel button and the "car" radio starts to transmit, the "pit" radio receives, all is well.

When I connect the driver helmet to this loom and power the car radio it immedialty switches into tx mode and it is impossible to talk to the driver, he can talk to me all the time though but it's not really useful.

I have checked the driver helmet's wire and there is no short between mic- and spk-, there is no continuity between mic- and spk- when I plug the helmet but I do not switch the radio on. I have tried with 3 different helmets and the result is the same.

The question is how do i solve this, it seems the baofeng is sending all the time some 2.3V into the speakers and mic outputs and it connects the 2 grounds together thus activating the tx mode.

Thanks for the help

Thanks guys. I have tried what you guys have mentioned to make this receive even using the latest Chirp daily build from here http://trac.chirp.danplanet.com/chirp_daily/LATEST/chirp-daily-20150702-installer.exe http://trac.chirp.danplanet.com/chirp_daily/LATEST/chirp-daily-20150702-installer.exe. I don't get any receive signal at all on any freq unless I press the MON button. I would like get this radio back to factory settings, but for some reason the N5R-219(factory).img image file that's on http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/ http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/ will not upload to my UV5R+, it just says the image is not supported by radio. I know this radio supports the N5R-219 FW because that's what is labeled in FW string 1 is N5R-219, but chirp won't load it. I think the N5R-219(factory).img is corrupted or something on the recovery site. Does anyone else have this image they would be willing to share? Gosh I'm glad these radios are cheap, what a hassle =) I don't have another Baofeng rig thank goodness, so either a down level version of Chirp screwed it up or the radio came this way. Not sure, but hopefully there is a way to unbrick the receive end on this.

Tnx, Rob

From: w7fj@...
Topic: 51338 Message: 51394

Ok Jim, I went back to an older daily version in 2013 based on the link you sent and the N5R-219(factory).img finally loaded completely without errors. With this image loaded the radio now has receive capability back, yeah!

Thanks so much for everyone's help on this. It would be nice if the website was updated to provide a link to the older versions of chirp =)

have you tried to disconnect the mic or speaker wires inside the helmet to try to determine if one or both are some how at fault, also is the ptt switch somehow grounded and when you connect the helmet that connector is making a path? years ago I had a similar problem with a race car also the jack was threaded on a mounting bracket as part of the roll cage and and everything worked as expected but when the driver got in and placed the stearing wheel on the shaft the radio would transmit in our case the ptt switch that was used had a small lamp and was intended as a everything is on indicatoe we didnt use it bu it was a 3 wire switch and one of the ptt lines was common with the lamp ground the easy fix for me was to unbolt the bracket wrap some elictrical tape around the rollbar and clamp it back together

I believe the obvious answer is that the two grounds are run as a common ground in the helmet. Now what to do about that? Is rewire the helmet to large a project?

51397. Re: Connect Baofeng into race car

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-10 06:37:08 UTC
From: jchuillier@...
Topic: 51391 Message: 51397

Well that's the strange thing, at the moment the radio is powered by its battery so it is not connected to the chassis in any way..

When i check continuity on the helmet's plug between the grounds there is none.

I cannot take apart the helmet plug because it's moulded but on the plug itself there is no continuity.

When I plug the helmet on the car AND THE RADIO IS NOT POWERED ON there is no continuity between both grounds on the female plug of the car where the helmet's male plug is inserted.

That's why I think it's really a baofeng issue and I'm curious as to why does the radio send 2.3V to the spk and mic lines (I measure that at the junction between the helmet and the car) as soon as it's powered ?

I'm wondering if I should put a capacitor between + and - on the mic. But which value ?

Is it possible that the mic in the helmet is a capacitor type and gets charged by the radio and then somehow gets enough power to connect both grounds ? It makes very little sense but it's the only thing I can think of.

Thanks for the help

jchuillier,

I had the same problem when I was trying to wire a nano-node into a BF-888. I'm assuming you're using the correct pinouts...

If your switch is showing continuity between the SPK- and MIC- when the switch is open (I'm assuming it's a normally open switch), then it's a wiring problem. Mine was a a small drop of solder that I didn't see had grounded itself to the project box case.

Another quick check is to DC the SPK- from the switch and see if the radio keys when you start the car, then you know it's a problem in the MIC- wire.

You shouldn't have anything connected to the +V wire/pin, it's useless for what you're doing or the TX Data wire/pin.

This is a simple schematic of what you're working with, and it may help you track down the issue...

I hope this helps!!! Let us know how it works out!

73!

Hello,

Thanks for the idea but no, when I check the grounds on the helmet plug they are not connected, there is no continuity between both grounds, the helmet has a 4 contact peltor plug and none of them are connected together....

The radio is sending 2.3V on the mic and spk lines as soon as it's powered and I think that could be my problem.

What could I try to prevent this current sent from the radio to make it think I'm pushing the steering button and switching in TX mode ?

Thanks

51400. Re: Connect Baofeng into race car

Yahoo group: baofeng_uv5r (2015)

Topic: 51391 Message: 51400

Thanks for the idea.

There is no continuity between the mic- and spk- in the helmet, in the car, when the helmet is connected to the car AND THE RADIO IS OFF, there appears to be continuity as soon as the radio is switched on because the radio switches to TX, the funny thing is that as soons as the radio is on there is 2.3V on the spk line (+ and -) and on the mic line (+ and -)

I have checked and checked again my wiring and soldering and i really don't think it's there, it's really a radio thing which sends some voltage on the spk and mic lines as soon as it's powered.

I'm thinking I should put a capacitor or a resistor between the gnd of the mic and spk or between the + and - of the mic but i have no knowledge of this.

Of course when the helmet is connected, the radio is on and it's on tx the mic works great and from another radio I can hear the helmet's mic.

If I don't connect the helmet and power the radio it stays on RX mode, I can see the rx light when I press tx on another radio and when I press the steering wheel switch the car radio switches to tx and the "pit" radio switches to rx...

Really weird one, looking for more help :)

Thanks

I have to say that using an HT inside a car really REALLY cuts down the range. UHF will be a little clearer at closer ranges, but VHF gets cut down a LOT trying to go through the metal.

The best option is to go with an external antenna. I don't think you're going to be doing any DXing on this trip and you'll most likely be within a mile of each other... so here's a couple of "cheap" external antennas.

http://www.amazon.com/Authentic-Nagoya-UT-308UV-SMA-Female-BaoFeng/dp/B00XQ9H9OC/ref=sr_1_2?s=electronics&ie=UTF8&qid=1436510495&sr=1-2&keywords=sma+female+magnetic http://www.amazon.com/Authentic-Nagoya-UT-308UV-SMA-Female-BaoFeng/dp/B00XQ9H9OC/ref=sr_1_2?s=electronics&ie=UTF8&qid=1436510495&sr=1-2&keywords=sma+female+magnetic

That one is a little more expensive, but it is getting great reviews and has been tested on Miklor and reviewed there.

The other one is a copy of a Nagoya ...

http://www.amazon.com/UT-108UV-Magnetic-Vehicle-mounted-Antenna-Booster/dp/B00SY1SFEA/ref=sr_1_26?s=electronics&ie=UTF8&qid=1436510522&sr=1-26&keywords=sma+female+magnetic http://www.amazon.com/UT-108UV-Magnetic-Vehicle-mounted-Antenna-Booster/dp/B00SY1SFEA/ref=sr_1_26?s=electronics&ie=UTF8&qid=1436510522&sr=1-26&keywords=sma+female+magnetic

I use it for "local" use basically within 2 miles and it works quite well.

The nice thing is these antennas are small and really not noticeable, but they work. When you get where you're going, just remove the antenna and throw it in the back seat. The coax is thin enough to sneak through the weather stripping of the door without causing any noticeable increase in road noise. Just make sure to mount then at least 2 feet in from the edge of the door on the roof of the car and you'll be fine.

My experience with the roof antenna is that the radio receive stops
working. As mentioned earlier, overload, and all.

If your over loading the received with the antenna on top of the car then
you have RF coming back down the coax.
Put beads at the base of the antenna.
.
You keep posting your problem with the HT but you need to use a SWR and a
FS meter

I've been using a roof mount magmount for close to 3 years, no issues. From inside the vehicle, even with a better than stock antenna, range is about a mile at best.

What is this beads process? I've never heard of that.

As to SWR and FS meters, don't own either of them,
and no money to buy one. From what I read on the
net, neither is likely to help.

Why would RF reflected back down the coax make
any difference when I'm in receive mode? Don't think
the radio sends out RF while in receive.

I'd sure like to have RF coming down the coax when
the antenna is connected, that's what antennas do.

At this point, just not sure what you're trying to say.

Are you in urban or rural areas? The two times I remember
losing receive, I was in commercial areas with overhead
power wires.

I'm not sure about car to car, but I've used a repeater which
was 20 plus miles away (would have to mapquest it) with a
rubber ducky from inside my vehicle. This on two meter band.

Never had that problem.

Always had a better receive and transmit from external mag mount vs. high gain ducky inside car.

Christopher,
You might want to connect with a more experienced ham in your area, who has the test equipment mentioned, and have your magmount antenna tested. It should be easy to narrow down whatever is reducing the effectiveness of your external antenna. A quick guess is possibly an intermittent connector problem.

No,
Cheap coax,weak front end on the HT,RF coming back down on the braid.
Could be many things
Do a search on the web and try to find some cell phone coax.
They make it for the higher frequencies and because being mobile,the run is
short so losses's are just about zero

Is it possible you could draw out the wiring from the plug to the helmet that you did , don't use the diagram that you used to wire it do a fresh one that way you will know for sure what wire goes to what and use a ohm meter to confirm where each wire goes do this without the helmet connected and either post a picture here or you may send it to me directly zardaz@softhome.net the voltage you talk about I can't say for sure since I don't have a speaker mic for mine but lots of radios use a electret mike that is powered from the radio, the mic circuit puts dc voltage to the mic on two wires and there is a cap inside the radio that passes the audio and blocks the dc voltage most electret mics run on 3 or so volts so that might be what your measuring you didn't say if the mating connector was a factory plug and molded or did you do the wiring to it not the helmet side the other one that goes to your added circuit just wondering...

Propagation questions are always tough questions. As you have already seen too many variables. I would lean toward vhf in the vehicles. The frequency is a little more forgiving of the Fresnel issues. A magmount is best, we have already beaten that dead horse. If you want to message my privately we can exchange info and do a twisted pair conversation.

In receive mode, there should be a RF signal coming
through the coax line, if there were no signal, the radio
would be either silent or static, in receive mode.

When you're trying to recieve, how much RF does your
radio send up the center conductor?

So, tell me, how does your radio work, when you have
it in receive mode and no RF is coming through the
coax? Work okay for you?

Remember, please. My issue with the BF (we've strayed
a bit from the original subject) is receive. well, it's some
what on topic, as road trip with a roof antenna might be
issue with receive blanking out.

I got a tech ticket by taking a ten week course, studying,
reading the book, and taking an exam which was graded
by three VE, and sent to FCC.

How did you get your CAPS LOCK KEY stuck?

Thank you, Mr. Ames.

(please note the respect and kindness which I am
using, sir.)

Back on subject. I'm still curious if the very fine person
who posed the question ever does a practical test. I'm
curious if VHF two meters or UHF 70 cm works better,
car to car.

Years ago, a friend and I did try FRS handi talkies. This
was in city environment, with power wires and houses
close together From his front porch to inside my vehicle
we could get 0.7 miles, with Motorola FR-50 handi
talkes.

More recently, a friend has a FRS mobile, the old Radio
shack with the magnet mount antenna. On the way to a
meet up, I was able to hear him well over a mile, me using
my handi talkie in the vehicle. He could not hear me, no
surprise.

"When you're trying to recieve, how much RF does your radio send up the center conductor?"

Technically, If you have a Superheterodyne receiver, and most all HTs do, It will transmit a tiny amount of the IF Signal. This is how Police Radar Detector Detectors work. They receive the IF signal from the illegal Radar Detector.

It was even worse with the regenerative receivers. The receiver would transmit almost as strong a signal as your transmitter

The point that the other fellow (the one who actually understands things) was trying to make is that the "RF" you are talking about would only occur while the radio is transmitting -- or in the presence of an external RF field so strong that the radio would be totally deaf with or without any antenna. As for your question about how he got a Tech ticket, I would wonder the same about your Extra ticket except that I know that this is just one more example of the difference between memorizing test answers and understanding the concepts.

Bottom line: He is right, you are wrong. The only "RF" involved on the coax during receive is what is going from the antenna to the radio.

From: R Pryor MAEd CETsr
Topic: 51338 Message: 51437

This problem happened to me too.

Here is how I corrected it.

I ended up doing a factory reset
Downloaded from radio
erased all the channel memories
went through each page in browser and compared another 219 radio (erased and reset)
edited some changed Hex strings in unknown blocks so they matched

Wrote back up to the radio and restarted the programming again

I will NOTE this only happened to radios with 219 FW

Another method I used was I read the bad one into RT systems made some changes in RT then uploaded, then switched to Chirp and read from radio and Chirp read the radio properly.

Thankfully the ones that were screwy were limited to 219 FW only concerning the problem that it is the wrong FW where the radio says it is the correct firmware.

Subject: [baofeng_uv5r] Re: Looking for a N5R-219 FW image?

Thanks guys. I have tried what you guys have mentioned to make this receive even using the latest Chirp daily build from here http://trac.chirp.danplanet.com/chirp_daily/LATEST/chirp-daily-20150702-installer.exe. I don't get any receive signal at all on any freq unless I press the MON button. I would like get this radio back to factory settings, but for some reason the N5R-219(factory).img image file that's on http://kc9hi.dyndns.org/uv5r/programming/CHIRPrecovery/ will not upload to my UV5R+, it just says the image is not supported by radio. I know this radio supports the N5R-219 FW because that's what is labeled in FW string 1 is N5R-219, but chirp won't load it. I think the N5R-219(factory).img is corrupted or something on the recovery site. Does anyone else have this image they would be willing to share? Gosh I'm glad these radios are cheap, what a hassle =) I don't have another Baofeng rig thank goodness, so either a down level version of Chirp screwed it up or the radio came this way. Not sure, but hopefully there is a way to unbrick the receive end on this.

Tnx, Rob

Make sure that the mic and speaker lines in the helmet are completely separate.

Also make sure that you have not connected the tip of the microphone plug - this terminal carries a permanent 3v - or the ring of the speaker plug - this is a data line and may well have a voltage on it.

The only earth point is the sleeve of the speaker plug.

Does the problem occur if you connect the helmet to the radio outside the car?

You could try a capacitor in the speaker or microphone leads in the helmet or adaptor lead; I'd use around 100uF for the speaker and 1 to 10uF for the microphone.

I'm sorry, do we have a problem? Your words are English, but they don't
make much sense.

I posted one email to this thread at 10:31 this morning where I said (a)
it's uncool to post a link to someone's personal info when they clearly
don't want it posted, and (b) not putting your call in every email doesn't
mean you don't have one. I stand by those comments.

You then sent 2 blank emails to me, one to each of two of my email
addresses.

I don't know what sort of lousy detective work you _think_ you're doing,
but if you have an issue with me, out with it. Otherwise take your creepy
internet stalker harassment elsewhere.

Since your email program doesn't seem to handle from addresses properly,

I totally support that position. Unfortunately too much private information is made public by our call signs. In this era of identity theft, why feed the bad guys a head start. We are people first and HAMs second. We could easily lie and grab any call sign and name from multiple public databases and present ourselves as any licensed Amateur if we wanted, so adding our call sign accomplishes nothing to validate our status as licensed anything.

Actually Bob I think you meant "shield." The coax is the combination of core conductor, dielectric/insulation and shield. So indeed RF is supposed to go both ways in the coax, just not in the shield.

If you build an antenna,use a small fluorescent light tube and run it
along the coax.
You just may see RF going down half the run of your coax.
RF on the braid is nothing but a waste of your power getting lost.
Reason they put the choke at the feed point.
You said ~~>So indeed RF is supposed to go both ways in the coax, just not
in the shield.

As it should work. External antennas with its higher height, not enclosed in steel will and should always work better.

I know the theory behind overloading the receiver with external antenna, but I feel its more urban legend.

And if it is true, the rare circumstances it does happen, is very rare. And if a stronger signal is overwhelming a weaker signal on receive, using a poorer antenna for receive wont help you pull in the weaker signal better.

When I am in PA working a repeater on 2 meters from my car. I do lose the repeater more because of geography then power lines or such. About 30 miles from the PA border while crossing NJ, I can work the repeater fine. But when I am in PA Heading northeast, I start to lose the repeater maybe less then 10 miles. my issue is more about mountains, then powerlines or overloading the receiver.

Are you in urban or rural areas? The two times I remember
losing receive, I was in commercial areas with overhead
power wires.

I'm not sure about car to car, but I've used a repeater which
was 20 plus miles away (would have to mapquest it) with a
rubber ducky from inside my vehicle. This on two meter band.

It will help if the weaker signal is right on frequency you want to hear and the stronger signal is off of that frequency but swamping the front end of the filterless baofeng.

It happens all the time. The best example is the case where tow people with baofengs in the same room try to access a repeater.

One transmits to the repeater the other listens and hears nothing, because the first baofeng has swamped the front end of the receiver even thought he is listening on a different frequency. By the way this would never happen to a pair of Icom 1c-v82

Christopher,
You might want to connect with a more experienced ham in your area, who has the test equipment mentioned, and have your magmount antenna tested. It should be easy to narrow down whatever is reducing the effectiveness of your external antenna. A quick guess is possibly an intermittent connector problem.

Then obviously you have very limited experience with the BaoFeng UV-5R family of radios.

> And if it is true, the rare circumstances it does happen, is very rare.

I can guarantee that it is NOT RARE in Brooklyn NY, where you claim to reside. Nor is it rare in just about any metropolitan area.

> And if a stronger signal is overwhelming a weaker signal on receive,
> using a poorer antenna for receive wont help you pull in the weaker
> signal better.

That much is technically true, but it is unrelated to the issue of degraded usability of the UV-5R radios in any environment with a strong in-band/off-frequency signal. The issue with overloading the front end on these radios is generally not related to a strong signal close to the receive frequency but rather a strong signal anywhere within the very broad passband of the radio. Such signals do not actually interfere with the desired receive signal per se, but rather cause the squelch to break in a repetitive random manner causing frequent (sometimes nearly constant) bursts of "static" when there should otherwise be no receive audio at all.

Back to the original post...

It sounds like you want to talk car-to-car in a caravan. If you're only going a few car lengths, either VHF or UHF should work fine.

I've used cheap FRS bubble pack radios (without an external antenna, obviously) to talk car-to-car with up to a 1/4 mile separation without issues.

I must be very unlucky, have been the victim of urban legend, twice. Once was at the bank drive up window, when I tried the roof antenna and lost receive. The second time was when I was volunteering for a charity event. We had a base camp of sorts at a factory, and I was doing radio test. There was another fellow standiing next to me. I called net control, and wondered why they didn't answer me, after I called three or four times. He finally pulled out a non Baofeng HT and told em I could not hear net control. He then got out a mobile set and mag mount antenna for me to use. I hate it when that happens!

It has been a lot of rain, lately. However, the two times I lost
receive were in dry weather, and the antenna had not been
rained on.

That said, there is a picnic today, and I'm meeting the fellow
who taught my radio class. He's got some test equipment,
and has offered to check things for me.

Thank you for sharing your experience; what worked for you.
Always appreciated.

Well, the only thing I could add is VHF works better in the open because the longer wavelength diffracts more around an object than UHF and in the city UHF Works better because it can get through small "openings" better than VHF and can reflect better from smaller surfaces. That's my understanding.

The higher the frequency, the more easily stopped. We used 900 MHz routers
to punch through leaf cover that would block our 2.5 GHz routers.

All I can talk about is my experience. Where I live in Brooklyn, it is a neighborhood of hi rise apartment buildings. A block away from my home is a hospital, Fire Department, Police Department. On the roofs are private repeaters that operate UHF mostly, some VHF. Those include private and housing frequencies. I live near a amusement zone, private radio use.

I have some transit frequencies programmed in my radio. Using just the rubber duck antenna, I can listen to transit yards around the city.

When I first got the Baofeng, I compared it to my Icom 32AT, testing both radios into nearby repeaters, transmitting on one, listening on the other. Yes, transmitting into a repeater on my 32AT, I heard myself on the Baofeng. And that was using a magmount antenna on the Baofeng.

I havent had ignition noise on any radio since after I drove a 70 dodge dart. I currently drive a 07 Jeep Liberty. I can monitor a repeater about 100 miles from home. It is spotty, but I hear it. That is even using a 12 volt eliminator for the radio.

If someone new comes on this group and reads about front end overload making the radio useless in urban environments or locations with overhead power lines might be scared by all this talk. I am just stating the issue might be greatly overblown by some people here.

I have never had an overload problem with any of my baufengs. I can't help but think some of these guys run the squelch either on the edge of the break through or just plain open just so they can find a fault with a $30 radio so they can feel better about the $300 they spent on a big name radio. 'Nuff said! they work like a charm for me...

?

All I can talk about is my experience.? Where I live in Brooklyn, it is a neighborhood of hi rise apartment buildings.? A block away from my home is a hospital, Fire Department, Police Department.? On the roofs are private repeaters that operate UHF mostly, some VHF.? Those include private and housing frequencies.? I live near a amusement zone, private radio use.

?

I have some transit frequencies programmed in my radio.? Using just the rubber duck antenna, I can listen to transit yards around the city.

?

When I first got the Baofeng, I compared it to my Icom 32AT, testing both radios into nearby repeaters, transmitting on one, listening on the other.? Yes, transmitting into a repeater on my 32AT, I heard myself on the Baofeng.? And that was using a magmount antenna on the Baofeng.

?

I havent had ignition noise on any radio since after I drove a 70 dodge dart.? I currently drive a 07 Jeep Liberty.? I can monitor a repeater about 100 miles from home.? It is spotty, but I hear it.? That is even using a 12 volt eliminator for the radio.

?

If someone new comes on this group and reads about front end overload making the radio useless in urban environments or locations with overhead power lines might be scared by all

this talk.? I am just stating the issue might be greatly overblown by some people here.

I was just saying it was a possibility. I have noticed the occasional car on VHF with the Baofeng and an outside antenna. Rare but it does occur. Won't even talk about HF!

Bob WA2EGP. From NJ, the most traffic congested state.

Net heard Chris each time. But Chris receiver was
over loaded, Chris did not hear net.

The other fellow, Charlie, could hear Net on his
HT , and finally told them (net) that Chris can't
hear you.

Charlie, bless is heart, loaned me a mobile with
magmount and lighter plug. Which I used, and am
very thankful to him.

Thank you guys for all of your answers.
I know that best solution is to have mag mounted car antennas. But I do not have time to order it to come on time. I will try to go with VHF because we are going to travel country side. When I return from my trip I will test how different frequencies are going to work.
We all know if we have good antennas, good radio equipment, good location that our communications are going to work well. For me it is interesting to test how this Chinese radios are going to behave and how to get most of them when conditions are not perfect.
It would be interesting if you guys can also test car to car communications without mag mounted antennas and see what results you are going to have. Also I think it would be good idea to use GPS to precisely know distance between two vehicles and have clear knowledge of terrain.
In my city for communication between hams we use simplex channels on 2m in the city. With outside mounted antennas Baofengs work good and sound comes without any or very little static. But when two Baofengs communicate using standard antennas on 800 m in the city there is lot of static on 2m but when using 70cm frequency range there is no very little static. I will see how this is going to compare with car to car coms.
Do you guys have similar experience using radios in the city and what do you think is best way to conduct this experiment objectively?

Best regards,
9A3AYY.

The two times I've had silence while a RF signal (on my
freq, which I wanted to hear) was active were both in
presence of electrical power, and using roof antenna.

One time was at a shopping mall, where I was near over head
power wires.

Other time was in a factory complex, where they must have
been using a lot of power. Second time was the one I've
been discussing in this thread.

No, someone else wasn't using a trasnsmitter close to me.
No, someone wasn't on a different frequency.

Sorry... this just does not add up to me. There is something else going on that you are not realizing is interfering with your receiver. There is a setting that only allows transmissions with a sub audible tone to be heard. That should be disabled. My only guess on this matter. Power lines interfering with your receiver? Not happening.

In the case of the bank at the mall, I do remember that the rubber ducky antenna worked, but the roof antenna did not. What changed? I took off the ducky and put on the roof antenna.

In the case of the industrial complex. I have less certain memory, but reasonably sure I was listening to the net control on the repeater with the rubber ducky before I arrived at the complex. And before I put on the roof antenna.

The PL / CTTS tone wasn't an issue with the rubber ducky antenna.

I would just like to know you don’t have the receive PL enabled. Could you be receiving even the slightest interference making the receiver not hear the sub audible tone? I cant dismiss it. Strong enough interference causing the receiver to loose the signal totally?? That I find hard to swallow. It just doesn’t make sense to me. Been working repeaters for decades, never had a issue where the repeater heard me, but I didn’t hear the repeater. Remember, you said no one else is transmitting near you. You think it is interference from overhead power lines killing your ability to receive a signal. There is something else going on.

I have two radios. Whether it is in a urban Brooklyn neighborhood or a suburban neighborhood with overhead power lines, even at malls or shopping centers, whether the rubber duck antenna, or the mag mount antenna on top of my car, never had a issue of receiving the repeater. Of course with low power of the HT, there are plenty of times I can hear the repeater, but it cant hear me.

The only real suggestion I can make is this. The next time you find yourself in a situation where you suddenly stop hearing a repeater, and you think you should, instead of listening to the repeater in a memory channel, change to VFO, enter the output of the repeater, make sure the receive PL is off, and open up the squelch. See what happens.

Remember you are dealing with a software defined FM receiver with no front end filtering. With FM you are looking at a capture phenomenon. The strong signal with an automatic amplitude control drops the sensitivity of the receiver to receiver only the strongest signal with no interference from the weaker signal. Only the strong signal is heard. Now that strong signal is off frequency so it may not be heard, so nothing is heard. It does happen to the baofeng.

The situation that was presented where it did not block, I would be willing to bet both baofengs were not on rubber duck next to each other. On might have been connected to an external antenna and the other on the duck. Is that the case?

Even so. Every case is different and there are so many possibilities. If I have not seen them all, I have seen most. :-)

I would just like to know you don’t have the receive PL enabled. Could you be receiving even the slightest interference making the receiver not hear the sub audible tone? I cant dismiss it. Strong enough interference causing the receiver to loose the signal totally?? That I find hard to swallow. It just doesn’t make sense to me. Been working repeaters for decades, never had a issue where the repeater heard me, but I didn’t hear the repeater. Remember, you said no one else is transmitting near you. You think it is interference from overhead power lines killing your ability to receive a signal. There is something else going on.

In the case of the bank at the mall, I do remember that the rubber ducky antenna worked, but the roof antenna did not. What changed? I took off the ducky and put on the roof antenna.

In the case of the industrial complex. I have less certain memory, but reasonably sure I was listening to the net control on the repeater with the rubber ducky before I arrived at the complex. And before I put on the roof antenna.

The PL / CTTS tone wasn't an issue with the rubber
ducky antenna.

Hey Chris,other night I did not intend to put you or others down but I did read anx one of my post were re worded. My vision is bad and I have COPD that there is no cure for. Now I'm in the hospital again and just want to say I have a box full of the UV5R ht's. I used them with a dal band centre loaded coil,,A dual band with no coil and works On 2 And 6 meters and the slim jim made of 450 ladder line and all work very well. As gar as RX over load I used a 5 watt FM BC transmitter but when I set it for 20 watts,Nothing was head more then a block away reason the mig powerful station may have their antennas several miles apart. With the metal roof over you at the band RF cold very well be bouncing All over except where you want it to. You received many suggestions and So far it seems UR trying but you should try another new HT or hook up with a club or local ham who has the right tools. Bob AF2Q

Sounds like you have more experience than I. So, tell me.
I can't make any sense of this, other than receiver over
load like that web site mentioned. Of course, now days any
one can make a web site. And you sound like you have
experience. How many Baofeng UV-5r have you used,
in power fields, and what did you experience?

Don't think I have PL for receive. And if I did, so what? I can hear the repeater with the rubber ducky outside the electrical zone.

The repeater in question does use PL. / CTTS.

In a "regular" receiver, the RF meter goesfull scale when enjoying an overload. In myBF, it just goes dead, and it could be anythingfrom a pager to an FM station or even closeby noise that's stronger then what you'retrying to receive. In my RF rich environment,440 works much better for me.

From: "Larry larry@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Remember you are dealing with a software defined FM receiver with no front end filtering. With FM you are looking at a capture phenomenon. The strong signal with an automatic amplitude control drops the sensitivity of the receiver to receiver only the strongest signal with no interference from the weaker signal. Only the strong signal is heard. Now that strong signal is off frequency so it may not be heard, so nothing is heard. It does happen to the baofeng.

Chris,

It's quite common for Baofeng radios to have their front end's overloaded by a strong signal. One of the issues a local Red Cross chapter was having is that they were using two VHF assigned frequencies that were only 12.5 KHz apart. The Baofeng radios went deaf on the first channel when anyone else was transmitting on the second VHF channel (only 12.5 KHz apart). Other model Wouxun radios in the same room were fine. To overcome the problem, they ended up only using the UV-5R radios outdoors at some distance (not close to each other).

High tension power lines are also very bad at giving off all kinds of RF noise. I drive underneath one on my way to and from work everyday that really tears up the Baofeng radios, the TYT units have "some" issues (nowhere near as bad), while my old Standard C5608 just hums along like nothing was there at all. Whether or not some want to admit it, there's a real difference between some radios that cost $30 and others that cost 10 times as much (or more). One of those benefits is usually a far better receiver with far more capability to block out unwanted signals and noise.

Yes that does in happen with the Baofengs more than the better transceivers. Here is a recent example. I am using the mobilinkd TNC2 to set up APRS on my BFF8+ and as a backup my Yaesu FT60R. The nearest digipeater is on the edge of range for me. Listening to the digital transmissions using my MFJ Long Ranger 1/4 wave telescopic VHF antenna I wasn't able to hear them when fully extended on my BFF8 but I was on my FT60R. This is a simplex configuration with no CTCSS either way. If I shortened it just a bit (decreased gain) on the Baofeng I started hearing transmissions clearly until it got much shorter then I started losing them again. I used an adapter and put it on my FT60R and no such problem occurred. The longer the antenna the better the signal strength. The same thing happened when I hung them off my Ed Fong J-Pole which was 12 feet above the ground. I started having stations well off frequency bleeding into my reception (even with CTCSS receive) until I went back to a duck using the Baofeng. Again not with the FT60R. The front end of the Baofengs is easily over-driven compared to other pricier radios. Does that make me think poorly of them? No. They have limitations especially when you put them on antennas with lots of gain. Their poor selectivity becomes a worse problem.

It has been interesting making side by side comparisons between these two radios. The FT60R really didn't make as much of a difference as I thought it would. But strong nearby signals are a weakness for the Baofengs. I can barely walk around in my home with the Baofeng on, because my wifi devices keep blasting it. Way worse than the FT60R or my budget Bearcat scanner.

Still they are well worth the money. They are just not mobiles or bases. As long as you do not have other signals near your frequency or strong signals of any frequency nearby, they work well even with higher gain antennas.

My uv5r+Plus gets an awful noise on 2 Meters and de-senses on 2 Meters and 440 on I-85 near Pelham Road (Near WHNS TV-21 Studios). I have not tracked down if the noise is in the Amateur Bands or out of band, or if it is actually coming from WHNS.

There is no limitation to the fidelity of AM radio. From a mathematical standpoint, AM does better in frequency response than FM. - Leonard Kahn

That's an interesting statement. Most of the loss of fidelity is due to the IF stage bandwidth limitations.

I would be suspect that there is something not right about that external antenna. I forget if you answered this or not but did you try it with another/different external antenna that works for someone else?

I agree with the other member. This is an on going discussion and he was given just about and the help he can get here. Find a local club,or a local ham with the proper testing gear. I'n the hospital that has more electrical crap and I work repeaters 15 miles from me. Might help if you tell us what antenna you have on the car. Anyway I'm gone as I'm on 25 list and run 2 and we talk about cW,ssb,antennas And building Kits. Buy a book from ARRL. I'm gone GL Bob AF2Q

I would be suspect that there is something not right about that external antenna. I forget if you answered this or not but did you try it with another/different external antenna that works for someone else?

Ideally, yes, that sounds good. I'm never totally sure if the
people will keep talking, but the concept is good. Many
times, the conversations on the repeaters only for a
minute or two.

We had a picnic, Saturday. I did meet with another fellow
who has inline RF tester. Find out my set is TX about 9
watts on two meter band. The SWR and reflected power
are both okay.

COPD is no fun. I bet it is a real concern when you are
on search and rescue missions?

I bought three of the magnet mount antennas. The one time at the bank was one antenna, and the volunteer event was a second one. My friend at the picnic tested both, and they were both okay for SWR and reflected power.

Both antennas worked fine in open areas, just not in urban or near power lines.

Hi Chris,

I am pretty sure that you are suffering from desense caused by "out of band" signals. The Baofeng has a very sensitive, but "wide open" front end for its receiver, and, for example, if you are listening to a signal on 146Mhz, (I think you Guys in the USA have your repeaters in that area?) and you get something nearby come up on 160 off Mhz, you are going to have some grief.

You could do worse than get a Wouxun UV6D. That is because it has a "track tuned" front end. Basically, the RF amplifier used between the antenna, and the mixer, has four tuned circuits, whose tuning varies according to where you are listening. That means you listen to 2 metres, and you have some rejection against 160Mhz, or 140Mhz.

However, I hear you regarding further expenditure on Amateur Radio kit right now. So you need to find a very inexpensive solution, and retain your Baofeng. Now this is where you CAN do something, and for VERY little cost. Look up tuning stubs. You can make a patch lead to connect the radio to the antenna, and if you get it right, you can get very effective filtration from it. You actually have around 12 1/2" of coax, "Teed" into the patch lead, and the far end of that piece of coax is shorted.

You can have two of these, with the "T" points 12.5 inches apart, You can have even more! If you have too many, you may well find that you start filtering out part of the two metre band.

The 12.5 inches is based on assuming a quarter wave for your allocation of two metres is around 19", and that your coax has a velocity factor of around 0.66

So, effective filtering for two metres for the rooftop antenna, at a cost of two or three dollars?

There is another advantage.... The tuned stubs as described will also filter the transmitter, preventing the radiation of "out of band" signals. The UV-5R is not generally a problem in this respect, but extra filtering never goes amiss...

Regards and 73,

Stan, G4EGH, who owns three of these lovely little radios, which are the worst receivers I ever had... But... Play as above!

That's a new idea. Would I need to purchase some coaxial
T adapters, and some lengths of coax with ends soldered
on? I used to operate soldering iron some decades ago,
but the coax with these is rather small. Hate to make a
mistake and damage the transmitter.

I'll admit, I've never heard of this system.

OK. That eliminates the antenna. I'm stumped. I know the power companies use the lines for communications but that's too low in frequency. Must be an awful lot of noisy devices on those lines and BPL is a dead issue (I hope). Going to have to check with mine and see if I can duplicate the effect.

Thanks for the idea. I did look on Ebay, these appear to have
the same frequency range as Baofengs, but cost three times
as much.

At present, my money situation is very bad. At some future
date, it may be better. But, they do look less than some HT
which I've seen around.

Question, if your radio suffers from out of band signals. Does the radio show it is receiving a signal, but no audio? If you opened the squelch, what do you hear, white noise?

The ones at the mall were on metal support frames, and
had rather large insullators. As such, I'd describe them as
transmission lines.

Don't remember if I looked to see the recieve antenna logo at that
moment. Also not all sure how to reduce the squelch. I'd had to go
through the menus and click it down. Didn't do either of those.

Ah Craig! Simplex on VHF or UHF. What a concept. I still use a TS 700a. What a rig. No pll cabability unless you add an external module. All mode 2 meter. Those were the days my friend. 2 meter CW. What? SSB? Way too OT, but it takes me back. Late 90's I dug it out of mothballs and started using it again.

The two times I had troulbe with no receive,the one
at the bank / mall, I was next to the drive up window,
and probably 200 feet from the power high voltage
transmission lines.

The second time at a volunteer event, I was in a
parking lot, about 30 feet from the radio trailer
(not sure if they were TX other than answering my
call, and I didn't hear thier answer) and 50 feet from
the building. No power wires in sight. I do remember
the fellow I met showed me they were using some
kind of antenna stuck to the inside window to get the
data out to the radio trailer. Might been 900 megs,
or maybe he didn't say.

Andrew,

I still have my Kenwood TS-711 and TS-811 units that I use occasionally, along with two different Yaesu units (FT-726R and FT-736R). I guess I can also count the Icom IC-7000 as well, although I haven't used it on VHF or UHF. Just got the RT Systems software and cable for it, so I may just have to program that baby before this month's hamfest in Williams, AZ.

Back in the day of operating so much VHF, our simplex group on 146.54 "borrowed" Nancy Reagan's slogan and changed it to "*Just say no to repeaters!*" Little by little, however, many of those guys moved, lost interest in radio, or simply (*shutter*) started using repeaters for everything. Of course, a few of us also hung out on 144.200 SSB. I used to love going to mountaintop locations and working both VHF simplex and HF mobile. Years later it's become a fashion to do so with SOTA. We did it long before it was the cool thing to do on weekends.

One guy in our group had a 4 element 40m beam (at his old place) and after his divorce took near everything (including the house), the ex-wife's lawyer successfully convinced the judge during the settlement talks that his client's no-code Tech license meant she might also have a desire to work HF "someday" so she got virtually all of his radio equipment as well. Somehow he managed to keep his gun collection and one Yaesu dual-band HT (perhaps she didn't know he had it in his old Jeep CJ). File that under "sometimes there is no justice".

He likes to say it could have been worse. He could have been forced to continue living with her (grin).

Yes, those would be transmission lines -- possibly carrying in excess of 20,000 volts. In addition to carrying high voltage, they also carry control signals for the electrical grid network, and guess what, those control signals are on a variety of RF frequencies, and with no filtering to reduce harmonics.

While the USUAL problem with BaoFeng radios from off-frequency signals overloading the front end is simply the annoyance of nearly constant bursts of 'static' (white noise) from signals that exceed the pitiful capabilities of the squelch system in these radios, it is also possible to experience DESENSING and/or FM CAPTURE EFFECT

-----Original Message-----
From: Christopher Young cayoung@... [baofeng_uv5r]

The ones at the mall were on metal support frames, and
had rather large insullators. As such, I'd describe them as
transmission lines.

Hi Chris,

Take a look at:

https://www.google.co.uk/search?q=2+meter+tuning+stub+filter&biw=1600&bih=1067&tbm=isch&imgil=m8o3qBN54otckM%253A%253Bhmz6WagWhhdTNM%253Bhttp%25253A%25252F%25252Fdl4xav.sysve.de%25252Fcoax.filter%25252Fcoax-filter.html&source=iu&pf=m&fir=m8o3qBN54otckM%253A%252Chmz6WagWhhdTNM%252C_&usg=__0srdzhPCNpxEb1MYs_o-44gseMo%3D&ved=0CCoQyjdqFQoTCOS0u6yM28YCFQSZHgodANcAUA&ei=HUClVaSyEYSyeoCug4AF#imgrc=m8o3qBN54otckM%3A&usg=__0srdzhPCNpxEb1MYs_o-44gseMo%3D https://www.google.co.uk/search?q=2+meter+tuning+stub+filter&biw=1600&bih=1067&tbm=isch&imgil=m8o3qBN54otckM%253A%253Bhmz6WagWhhdTNM%253Bhttp%25253A%25252F%25252Fdl4xav.sysve.de%25252Fcoax.filter%25252Fcoax-filter.html&source=iu&pf=m&fir=m8o3qBN54otckM%253A%252Chmz6WagWhhdTNM%252C_&usg=__0srdzhPCNpxEb1MYs_o-44gseMo%3D&ved=0CCoQyjdqFQoTCOS0u6yM28YCFQSZHgodANcAUA&ei=HUClVaSyEYSyeoCug4AF#imgrc=m8o3qBN54otckM%3A&usg=__0srdzhPCNpxEb1MYs_o-44gseMo%3D

where you will find a picture of what I am on about. It may not be entirely clear from the pictures what you need to do, but basically, the inner of the stub joins to the inner of the patch lead, ditto the outer, and after you have proved it is not shorted, apply the shorts at the ends of the stubs.

Yes, you can buy "T" pieces and plugs, and maybe after proving it does a good job for you, it may be worth a few dollars to do it real nice.

For the next part, ensure you know how to put the radio in low power mode, and check a small "L" appears in the top of the display. ALWAYS check this is there before transmitting, because if you are in memory mode, on a channel programmed for high power, as soon as you turn the radio off, or change frequency, it will revert to the high power setting.

See if you can get the repeater on the low power setting. Then connect via your home made stub, and, (check LOW power), try again. You should be able to open it using the stub, if you can open it without.

If there is something not quite right about the stub, it will most likely still work, but low power saves the transmitter.

If it all seems to work OK, get a local ham to help with an VSWR meter, to make sure all is well, and then use high power if you want. But remember, always use low pow, if you can...

You may care to do the tests very late at night, with the possibility of there being little strong, local traffic. If you then find that daytime use needs the stub, you will know what the problem WAS... :-) And best of all, you will have built something that cost virtually nothing, learned a lot, and made your station work better.

10 years down the road, you may help out some other ham with a similar problem...

Regards and 73,

Stan, G4EGH

An open quarterwave looks like a short at it's resonant frequency.An shorted quarterwave looks like an open at it's resonant frequency.
An electrical halfwave will show the same impedance at bothends no matter what the cable's impedance is.
A quarterwave in coax is 234/FMHz*VF (velocity factor)[.66 for solid insulation - .77 for foam]

51535. New UV5R Manual

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-14 22:20:43 UTC
From: Ian
Topic: 51535 Message: 51535

I just received a new UV5r which I bought for my wife, who just passed her Foundation Licence test and is awaiting arrival of the paperwork to be able to transmit.
I was impressed at the readability of the new manual that comes with it. I figure someone at Baofeng maybe read the miklor manual and updated theirs so it reads in proper english.
Of course I had trouble reading from the radio (radio refused to send block etc) with Chirp until I got the latest daily build as I had not used the version on this PC for about 6 months, but was easily then able to save the copy from her one and them copy across the same repeaters etc from my own.
Ain't technology great (at times)!
Now I just have to remember to update the repeaters on my HF/UHF rig as well...

In reality, the first version of that "new" manual was done several years back by a chap named Len and was called "The Chinese Radio Documentation Project".

Since it was released as an open source document, it was quickly modified by several different folks, including Jim on this forum, and was then later copied almost word for word as the "new" manual from Baofeng Tech in South Dakota for their BF-F8HP.

I've also noticed a much better manual shipping now with the BF-F9V2+ units as well, which appears (again) to be heavily copied from Len's original manual (with Jim's updates), so it would not surprise me one bit that Baofeng China has finally copied it as well. The only real surprise is how long it took for the Baofeng factory to copy it as well.

Hello Ian

From your post I gather that you have the UV-5R and your friend has the BF-F8HP. If this is correct the problem, as I understand it, may be due to the new configuration of the HP to allow multiple power settings different from the UV-5R version.

This has a simple solution, simply update your version of CHIRP to the most recent daily builds and your problem will be solved. CHIRP does support both these radios.

Hope this helps

51551. USB charging cable.

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-17 21:49:56 UTC
From: nospam@...
Topic: 51551 Message: 51551

I thought this might be of use to people. I have a UV-5B, so no battery with charging port available for me.

I go out on longer fishing/camping trips and rather than take an extra battery for each radio I'll just bring along a charging base, the charging cable, and USB battery pack. I already use the battery pack for a phone and some other electronic devices.

I made up my own cable that boosts 5V USB to 10V for the charger, but I can see you can really just buy the whole thing put together if needed.

Search 'USB dc boost converter 2.1mm' to find something that will work right out of the box. You will need to use the adjuster to get it to 10V and make sure centre is positive. I used a 5V to 12V boost converter, modified the output reference for 10V and soldered on the USB connector and 2.1MM jack. If you are okay with soldering, you can save a couple dollars, just get the (adjustable DC boost converter) and solder on a jack and USB plug sacrificed off of a USB cable and some other charger.

The boost converter is not stressed. It doesn't get warm at all. I'm using a cheap $3 charging base rather than the OEM base. The base I bought uses the standard HXN-WS charging chip. To cut down the amount of space it takes up I might just break down the charging base, but I can't think of a reliable and easy way to connect the contacts to the battery just yet.

Which charges the radio quite well. I've used my a LOT. Have a solar battery bank that's like 14 Amp, and it even charges the 3800 mAh batteries for the UV-5R series.

So now you got me thinking about how to make a charger that uses the guts of that one, but has the plug into the extended battery. Talk about the best of all worlds!!! Extended battery, solar charger battery bank, etc etc etc...

Ok... time to break out the soldering iron and screw driver!!!

Not really shocking - many sites don't renew their certificates (which are essentially worthless anyway) until after they expire. Just like many sites have certificates that don't "match" because they have multiple domain names or just slightly different URLs. As a US government employee I routinely found that at least 25% of federal government sites have certificates that are "invalid" for one reason or another (which is really silly considering that the federal agencies issue their own certificates!)

From: cprendon@... [baofeng_uv5r]

Sorry, I looked at the individual photos and see that the cigarette lighter adapter converts 12v to 5v @ 1000mAh.

So you can plug directly into a USB port or use the cigarette plug.

But how does 5v charge a 7.4v battery?

Not a problem at all. A switching power supply takes the 5 volts at a higher amperage at gives you what you need at a lower amperage but higher voltage.
In the past we would do that with a vibratory based power supply and transformers.

51563. Trying to program UV5R to RECEIVE Baofeng 888s' factory #10 and #12 channels using CHIRP. Help?

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-18 19:10:16 UTC
From: everytimeidie7@...
Topic: 51563 Message: 51563

I need to program my UV5R to receive/listen (NOT transmit) to the channels that are pre-programmed on the 888s. I found this list of factory 888s channels and attempted to program with CHIRP. All seem to work except for channels 10 and 12. The radio will indicate via lights and LCD that it is receiving a signal however, no audio is played.

Here's a list of the supposed stock 888s settings:

Channel 1 frequency 462.125 - RX-TX 69.3 Hz CTCSS
Channel 2 frequency 462.225
Channel 3 frequency 462.325
Channel 4 frequency 462.425 - RX 103.5 Hz CTCSS
Channel 5 frequency 462.525 - RX 114.8 Hz CTCSS
Channel 6 frequency 462.625 - RX 127.3 Hz CTCSS
Channel 7 frequency 462.725 - RX 136.5 Hz CTCSS
Channel 8 frequency 462.825 - RX 162.2 Hz CTCSS
Channel 9 frequency 462.925 - RX 025N DTS
Channel 10 frequency 463.025 - RX 032N DTS
Channel 11 frequency 463.125 - RX 125N DTS
Channel 12 frequency 463.225 - RX 155N DTS
Channel 13 frequency 463.525 - RX 331N DTS
Channel 14 frequency 450.225 - RX 023N DTS
Channel 15 frequency 460.325
Channel 16 frequency 469.945 - RX 203.5Hz CTCSS

Here's what I have set in CHIRP. I do plan to set offset to 1666.666 to disable transmit.

Channel 10:
Frequency - 463.025000
Name -
Tone Mode - DTCS
Tone - 88.5
ToneSql - 88.5
DTCS Code - 032
DTCS Rx Code - 032
DTCS Pol - NN
Cross Mode - Tone-> Tone
Duplex - (None)
Offset - 0.000000
Mode - FM
Power - High
Skip -

Channel 12:
Frequency - 463.225000
Name -

Tone Mode - DTCS
Tone - 88.5
ToneSql - 88.5
DTCS Code - 155
DTCS Rx Code - 155
DTCS Pol - NN
Cross Mode - Tone-> Tone
Duplex - (None)
Offset - 0.000000
Mode - FM
Power - High
Skip -

Channel 13, for example, works just fine, and everything is the same except for frequency, and DTCS codes. So I'm not sure if I am messing up a setting or if the reference list above is incorrect for the 888s' channel 10 and 12.

Very cool. Yes, Mine would be about the same thing, except I can use the OEM charger cradle, though I will likely rip this cradle apart to try and make it more portable.

I do a lot of hobby electronics, so I had all of the parts for this already. I just had to finally put them together.

Mark Higgins

Don't use the test frequencies unless you
are 100% sure they aren't being used in yourarea. While not legal to use on your radio, you'd get in less trouble using MURS/FRS/GMRS
frequencies.

Do you have $10,000 to give Uncle Sam? ==
Have scanners, do listen.

I need to program my UV5R to receive/listen (NOT transmit) to the channels that are pre-programmed on the 888s. I found this list of factory 888s channels and attempted to program with CHIRP. All seem to work except for channels 10 and 12. The radio will indicate via lights and LCD that it is receiving a signal however, no audio is played.
Here's a list of the supposed stock 888s settings:
Channel 1 frequency 462.125 - RX-TX 69.3 Hz CTCSS
Channel 2 frequency 462.225
Channel 3 frequency 462.325

Channel 4 frequency 462.425 - RX 103.5 Hz CTCSS
Channel 5 frequency 462.525 - RX 114.8 Hz CTCSS
Channel 6 frequency 462.625 - RX 127.3 Hz CTCSS
Channel 7 frequency 462.725 - RX 136.5 Hz CTCSS
Channel 8 frequency 462.825 - RX 162.2 Hz CTCSS
Channel 9 frequency 462.925 - RX 025N DTS
Channel 10 frequency 463.025 - RX 032N DTS
Channel 11 frequency 463.125 - RX 125N DTS
Channel 12 frequency 463.225 - RX 155N DTS
Channel 13 frequency 463.525 - RX 331N DTS
Channel 14 frequency 450.225 - RX 023N DTS
Channel 15 frequency 460.325
Channel 16 frequency 469.945 - RX 203.5Hz CTCSS

Here's what I have set in CHIRP. I do plan to set offset to 1666.666 to disable transmit.
Channel 10:Frequency - 463.025000Name - Tone Mode - DTCSTone - 88.5ToneSql - 88.5DTCS Code - 032DTCS Rx Code - 032DTCS Pol - NNCross Mode - Tone-> ToneDuplex - (None)Offset - 0.000000Mode - FMPower - HighSkip -
Channel 12:Frequency - 463.225000Name - Tone Mode - DTCSTone - 88.5ToneSql - 88.5DTCS Code - 155DTCS Rx Code - 155DTCS Pol - NNCross Mode - Tone-> ToneDuplex - (None)Offset - 0.000000Mode - FMPower - HighSkip -
Channel 13, for example, works just fine, and everything is the same except for frequency, and DTCS codes. So I'm not sure if I am messing up a setting or if the reference list above is incorrect for the 888s' channel 10 and 12.

51566. Re: [baofeng_uv5r] Trying to program UV5R to RECEIVE Baofeng 888s' factory #10 and #12 channels using CHIRP. Help?

He clearly states he only wants to receive, not transmit. That's perfectly legal.

As to receiving - simply do not put in any receive tone and you will hear all stations regardless of what tone they use. If you put in a receive tone, then you will only hear stations that use that specific tone.

So why would you program the supposed channel settings? You have
CHIRP! Why would you set offset to 166.666. That's not how you TX
inhibit a Baofeng radio using CHIRP. The correct way is to set Duplex
= "off".

1 Download from the UV-5R into a tab.
2 Download from the BF-888s into a second tab. Click on 1 of the rows
of the BF-888s tab and then press 3 Click on the BF-888s tab
4 Click on one of the 16 rows to highlight it and then [Ctrl} + [A] to
highlight all 16 rows.
5 Press [Ctrl] + [C] to copy the highlighted rows
6 Click on the 1st row that you want to copy the BF-888s channels to
highlight it and then press [Ctrl] + [V] to paste them to this row and
the next 15 rows. (lets use row 101 as an example)
7 Click on row 101 to highlight it
8 [Shift] click row 116 to highlight all 16 rows
9 Click the [Preferences} button at the top of the spreadsheet style
memory editor
10 Tick the box in front of the "Duplex:" property to enable editing
and set the value to "off"
11 Click the [Ok] button

But if I understand you post, you many not have access to the BF-888s
radios. In that case you problem is that the DCS code that you have
programmed into channel 10 and channel 12 of your UV-5R does not match
the tone/code that is being transmitted on these channels from the
BF-888s. The thing to do here would be to highlight the 16 channels
per steps 7 and 8 above, go into properties and set Tone Mode = to the
top {blank] selection. You never need to program a CTCSS tone or DCS

code to listen. OFF always works.

But as others have already pointed out, using the "factory test frequencies" are a bad idea.

Jim KC9HI

I agree, what the original poster is wanting to do is legal. But I believe that the point being made is that the BF-888s radios are not legal. If they were obeying the rules, there wouldn't be anything on those frequencies to monitor.

I'm using a UV-5RA in my garage in a semi-permanent setup. I have wired up an old Radio Shack mono communications speaker (8 ohms) and get good audio output but I would also like to add a stand alone microphone. Anyone done this or at least know what the impedance is for the microphone input?

Kenwood microphones and accessories can be used with Baofeng HTs. I use the Kenwood SMC-34 with my Baofeng.

You'll probably have to brew up something yourself. Almost all transceivers these days do not have a critical input impedance, so almost any mic should work. I don't know if the UV-5R has bias voltage on the mic input, which is needed for electret mics. It might.

You can also see if you can find out the Kenwood mic impedance since it
would seem to work with your radio.

OR ... just try something and see if it works.

Sigh. So much for waiting for someone who knows the answer to post it, so I guess I'll step in....

There is this great new website that has all the answers to all your questions

Just ask a question and this new website finds the answer for you.

It's called GOOGLE !!!

Come on people, instead of answering questions that you don't know the answer to just to see your name on a message, either wait for someone who does know to answer, or if that fails, look up the answer for the OP who has never heard of Google

We all know there isn't much technical data about the BaoFeng radios readily available, but we all also know that the BF microphone connector is fully compatible with the Kenwood HTs - including the mics being interchangeable, so just do a quick search for "kenwood ht mic impedance" and surprise surprise surprise you find that Microphone Impedance, 2 k ohms.

Then, as a ham with knowledge of electrical circuits, you would know that for a microphone, 2k is considered "low" impedance (compared to "high impedance" mics that are around 100k ohms). As a ham, you would also know that on audio circuits the impedance doesn't need to match very closely, so long as the source is lower than the circuit it is driving, so just about any "low impedance" microphone should drive the BaoFeng mic input ok (of course, you also know not to use an electret mic unless you separately provide the voltage that it needs to operate).

Nearly all modern communications microphones are low impedance, so just about any non-electret microphone will probably work once the original poster works up a way to connect the mic and the PTT circuit.

Thank you for the information but you didn't have to be so condescending in your reply. Not everyone knows that the Baofeng is "fully compatible" with Kenwood. Yes, there are many who claim to use the accessories interchangeably but that is NOT the same as "fully compatible". Yes, I did search Google, yes I did do comparisons where I could and found that mics that claim to work on the Baofeng range in impedance from 2.2k to "<10k". All of that is useful information but there is nothing like the knowledge that someone has successfully done what you are trying to do. Isn't that what ham radio is supposed to be about? Your type of attitude is one reason I am not associated with the local club in my area. I guess "Elmers" are a relic of the past.

Hello All,

Received a new UV-5R today, wondering if my firmware as reported by CHIRP, BFB297 and N5R-20 is reasonably current and stable as compared to what others are getting?

The clear plastic window is sticking to the middle of the LCD display on mine, anyone seen this or found a solution?

TIA

Sorry that you got your panties in a wad over my reply, Joseph (despite the fact that it was the only reply that included the information requested). If you had bothered to actually read my reply you might have noted that I had absolutely no objection or complaint about the original poster's question, my "condescending" remarks were aimed at the unhelpful replies from people who simply needed to see their words on the computer screen.

It isn't unreasonable for newbies who know little or nothing about amateur radio to ask questions that anyone getting a novice ticket 30 years ago would have known and that anyone with a computer today could answer simply by expending a slight effort.

Elmers became an endangered species when newbies started thinking they were entitled to have all problems solved for them and everything spoon-fed with zero effort or knowledge required.

Some of them are showing up oversized again

Hold the radio in your right hand with the front part pointing to your left.

Look directly down at the jack body

You will notice the side to the right is closer to the edge than the side on the left. Some are coming slightly offset and recessed. Orientate the mic plug to see what edge is the narrow side.

Use a grinder and put a slight bevel taper on it at 35-45 degrees, then flatten the portion where the cable comes out of the mic plug. They have been putting raised round plastic in this area which causes the plug to bottom out on the radio body.

Make that flat to fit

I use a Dremel with a barrel sander drum at a low speed to do this

A number of headsets recently and mics are not fitting very well and it looks like the jack plate on some radios is more towards the edge too compared to others. I had to do this with all the Liberator and Bowman headsets I got in (PTT units) plus a few mics

<chuckle> You know, when I first subbed to the group I had issues with you Xaun, but a few months in, I'm getting into your schtick. A while back there was a guy clueless about "beads" so I took it offline to tell him to google ferrite. I got a reply asking for me to send him urls *specific* to ferrite beads and Baofeng HTs. Told him to google it himself...sheesh.

What folks who stumble in here need to realize (like I have) is that this is *not* a ham radio group, so any pleads for civility can get you laughed out of the clubhouse. The Baofeng is advertised as a "Ham Radio", but so are the 10 meter "export radios" you find in truck stops. The Baofeng is an *open* 2M/440 HT, and you can use it for Part 97, Part 90 and (Heaven forbid!) Part 95.

Because this is an open group, anyone can post, with the caveat that _anyone_ can reply. So any moderators moderating might be advised to include in the "Welcome" message when subbing the subber needs to put their asbestos suit on.

I agree. When I first met Xaun I was put off by his lack of respect for the new comer. I have since found that I respect his depth of knowledge and often also agree with his lack of respect.

Look past the wall he builds to hide behind and you will find a very intelligent knowledgeable guy with the right answer 99.9% of the time (I do remember once that lowered it to 99.9%, but I wont embarras his with it.)

Yes it doesn’t take much to start getting burnt out as the Elmer type.

Email is not that bad compared to all hours phone calls.

Well, I've said this before (that Xuan certainly doesn't need me to defend him), but in his defense (somewhat) older 1x3 callsigns used to indicate that the ham in question had a certain level of experience.

Nowadays, you need to search the ULS site first to discover if the "older" callsign was really issued years ago (or just a few months ago) under the vanity callsign program. Now that the FCC is dropping the cost of the vanity program, I'm afraid it will only get worse, because if the question was not listed within their "study-guide" there really is very little chance that most of the new U.S. hams would even understand the answer given, let alone why Xuan answered the way he did.

At least this guy knew what an Elmer was, a few (who claim to have spent years in the hobby) claim to have never heard the term before or that I just made it up.

And yes, Rich, postings are certainly better than late night phone calls (from some folks that still don't understand the difference between PL encode vs. decode settings) and then want to argue with you about the free help you're trying to give them. In this particular case, a new Tech was telling me that FRS privacy codes, CTCSS, and PL tones were all completely different types of technology, as FRS privacy codes were made specifically for FRS radios, CTCSS was for Baofeng radios, and PL tones were only used by government agencies. Did you also know that Motorola licenses their FRS privacy codes to other manufacturers (so that FRS radios can talk to each other)? No, I'm not making that up.

That's why when "some" new Techs ask about beads I really think they're planning a trip to some jewelry store to help improve their radio's performance. I may have to start making Velocity Factor RF Grease again and take to to various swapmeets where these folks hang out just to watch their faces light up when I explain not to put too much on their coax leads or their signal will overwhelm their buddy's radio down the block (grin).

51603. CHIRP problems with UV-5R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-22 06:13:09 UTC
From: wb8yqj@...
Topic: 51603 Message: 51603

I have UV_5R_VIP running 100% on my Win7 computer, really happy about that and the same USB driver and UV-5R cable supports my Kenwood TH-F6 as well. But no version of CHIRP I have tried will work reliably, I have tried today's version and compatibility version 0.4.1. The UV-5R will hang in transmit, I will get messages that the radio has refused to communicate, and messages from the program indicating a command timeout at the radio. On two occasions I stumbled into a proper communication link but cannot duplicate the steps. Any suggestions welcome, the Baofeng program is plenty workable.

Jardy,

Remember that's only to be used on "hard-line" to help keep the velocity factor below light speed. By the way, you guys will get a kick out of this ad on Amazon.

Remove the battery from a UV-5R, add a wall-wart/inverter, lay it flat on a table and call it a "business radio" for only $239.95. I fell off my chair when I saw it, so I don't know if that includes free freight or not (LOL).

I'm touched that all of you are so concerned with the state of my panties but rest assured that they just fine. I didn't realize that my question was as silly as asking about ferrite beads but I'm glad that I could bring a chuckle to so many people. I'm also touched that so many of you spent your precious time looking up my call sign. I may have a ticket with fresh paint on it but I was repairing radios in the military as far back as the late 1960's and then spent almost 30 years working for the former Collins Radio as a tech writer, tech instructor, and engineer. I finally got licensed so that I could help my father-in-law, a long time ham, when his health failed and he moved in with us. I understand the burn out of being a mentor, having spent much of my career and retirement in that role. But I also feel that knowledge that isn't shared is knowledge wasted. As I said previously, that's a big part of the issue I have with the local ham group. They weren't interested in helping me get licensed and they aren't interested in my offers of technical support. My hope is that you guys will learn from their mistakes.

Hi
Have just got hold of a couple of the uv5rs and would like to program them with chirp, have downloaded chirp and need to buy a cable but can't seem to find any image files for uk radio ham repeaters.

Also any scanning files, i.e.; shipping etc

Have looked in the file section and the only file i can see for the uk is PMR, does anyone know where i can get hold of the above please, id hate to program them all into the radio manually.

Well said.

No question is silly if you don't know the answer. Having been in the education field for 35+ years, I can understand that. Most here will honestly try to help, some, with less tact. The "Elmer" is on its way to extinction. (Grin)

The standard yous-gets-whats-yous-pays-for seems to apply here.
Seems others are having numerous problems with the QTY 8900Brick O'Lore: QYT KT8900: Dual Band Mobile
Same for the JT-6188 reviews on Amazon
My criteria for any radio is whether or not it's supported by Chirp. I think that's a good indicator of how popular/reliable they are. Obviously new radios take a while to be incorporated into Chirp.
Under $100 for a mobile is a scary number to me. I bought a JT270M and am happy with that at $140 though it suffers from selectivity problems so definitely wouldn't be good in urban environment.
I'll bet the < $100 ones suffer from selectivity problems too. Seems to be a common them amongst the cheap Chinese radios.

Agreed 100% that the driver should work for all programs if it works for one. I am also using the Prolific driver version 3.6.78.350 from the site you mentioned.

Since CHIRP works "sometimes" with UV-5R, I have been able to read the software version and memories, I have to think its a problem with the program rather than the driver.

UV-5R has just been a blast, it is sized perfectly for my pocket, has lots of audio, and good RF out - having loads of fun with it...

As long as your cable is plugged in correctly to the UV-5R Chirp will always work....barring USB noise interference.
The problem is typically in the connect to the UV-5R not being pushed in all the way.
Once I trimmed one of my cables (due to the GT-3 case getting in the way) I've never had any problems reading the radios I have.

Attachments: 1 described; binary payloads are missing from this source WARC

Yes I have them here is my mini setup in a portable manpack config

KYT 8900 manpack
https://onedrive.live.com/redir.aspx?cid=078cbc5ffe4b177e&page=browse&resid=78CBC5FFE4B177E!1420&parId=78CBC5FFE4B177E!1169&type=5&authkey=!ANEWmQ-mBhO5u_Q&Bsrc=Photomail&Bpub=SDX.Photos

It has a few strange quirks documented on Miklor but nothing serious at all.

You cannot be it for the price it is very loud just like the MP600 series. The only complaint is the usually factory software and problems with .dat files. The programming is more time consuming without the editing tools found in Chirp or RTS.

Most likely Chirp will support this model as it is on the support request list.

To date this is the BEST Dualband mobile (for the price) on the market.

Once this has better software support these will most likely sell as hot cakes. We took them a step further building these man pack, solar and offroad weatherproof systems for hard use.

IF ANYONE HAS A GOOD TAPE MEASURE STYLED DUAL BAND UHF/VHF antenna design please pass on to me. I am using telescopic antennas now with a spring base. The idea is to keep it portable enough to be carried around easily without the antenna being bent or broken. So far my antenna design for a military style antenna (PRC style) seems to be best for single band use requiring switching antennas between uhf/vhf

If anyone wants more pictures Email me

As long as your cable is plugged in correctly to the UV-5R Chirp will always work....barring USB noise interference.

Yes Mike, this was the initial frustration, knowing I had a problem with the speaker mic physical connection I was pushing like crazy every which way trying to get the USB cable to seat/work.

But, the USB cable works every time with the Baofeng program and almost never with CHIRP.

The highly intermittent nature would point to USB noise or a level problem (CHIRP warns you about this), I could go with the connector theory if the Baofeng program had a problem.

I will say that I read a lot on the web, user frustration and unhappiness, and now I can understand that if you get this very neat little device and it is all ready to go, just to find that you cannot get the computer connection to work, and maybe you haven't found the Lidberg-Unroe document to enter a frequency into the radio - I can understand the over the top reactions.

Compounding the picky nature of the drivers with an intermittent physical connection would make that side of nearly impossible, that's why I decided to break off wrestling with the USB cable and test with UV_5R_VIP.

There is a ton of good info out there, even outside of this list so if a guy can get a jump on the learning curve before the unit arrives, it maybe possible to retain some sanity on delivery day - hi...

I have one and the performance is pretty good.
Selectivity in a metro area isn't too bad, but some stray intermod may tend to sneak through.
Heat dissipation is pretty good. I use mine here in the computer room as well as the car.

A review can be found at (surprise!) http://www.miklor.com/COM/Review_KT8900.php
http://www.miklor.com/COM/Review_KT8900.php

There's also a support group at https://groups.yahoo.com/neo/groups/KT8900/info
https://groups.yahoo.com/neo/groups/KT8900/info

For under $100, they're not that bad at all.

They DO get hot but the mini case has the TYT/Zastone th9000 /Mp600 heat sink fins on it. If you use really long QSO xmt cycles heat might need to be monitored or a good fan on it.

I generally talk very short periods so have not found heat to be an issue for me. I even ran it on a solar panel during field day and 4th of July weekend in 90F heat. Held up real well.

The metal can we used has a good top vent for the manpack and the heat sink is further enhanced with contact on the 30 cal ammo can. I might put a toggle switch and a modem fan on it- if heat becomes an issue or offer it as an option.

Maybe some thermal compound too if needed.

So far so good but it does get warm.

This is true but most of the complaints are the typical Chinglish manual, USB problems and programming issues.

I think once Chirp supports it, these complaints will be less. However, there is one interesting thing I found. You must use the QYT programming cable. Other cables with the exact same programming pin ends WILL NOT WORK.

The Comm port can be found by the software, but data is not read properly. I suspect RXD and TXD are reversed on the jack pins of the unit requiring the QYT cable to be used.

Brick O'Lore: QYT KT8900: Dual Band Mobile
I get the marketing e-mails from 409Shop and the QYT KT8900 dual-band mobile caught my eye - just because the price was less than $100. Frequency Range: VHF:1...

Sometimes I wonder if I should get a vanity call sign or keep my Newbie call sign. Vanity would help during field day though I would pick something easy to hear in the noise. W6DUM might get a few chuckles I was tempted getting that one. All in all I kept my original call sign that is most given out to the last few years of tech class holders.

Once in awhile someone hears my call sign in an interesting QSO on something technical and would say something about getting my General Class first before I make a technical comment (LOL)

All is fun though except the wife hated the late calls from drunks on camping and hunting trips that could not understand Dual Watch, TDR or A/B switch functions. They could not contact Billy Bob back at the RV to bring cold beer back to them 3 miles away (because they were talking on the wrong A or B line)

Got a pair of TYT MD380’s digitals in will play later with them.

Picked up a Yeasu FT 757 for a few bills at the swap meet in almost mint condition. So much fun and so little time.

Well, I've said this before (that Xuan certainly doesn't need me to defend him), but in his defense (somewhat) older 1x3 callsigns used to indicate that the ham in question had a certain level of experience.

Nowadays, you need to search the ULS site first to discover if the "older" callsign was really issued years ago (or just a few months ago) under the vanity callsign program. Now that the FCC is dropping the cost of the vanity program, I'm afraid it will only get worse, because if the question was not listed within their "study-guide" there really is very little chance that most of the new U.S. hams would even understand the answer given, let alone why Xuan answered the way he did.

At least this guy knew what an Elmer was, a few (who claim to have spent years in the hobby) claim to have never heard the term before or that I just made it up.

And yes, Rich, postings are certainly better than late night phone calls (from some folks that still don't understand the difference between PL encode vs. decode settings) and then want to argue with you about the free help you're trying to give them. In this particular case, a new Tech was telling me that FRS privacy codes, CTCSS, and PL tones were all completely different types of technology, as FRS privacy codes were made specifically for FRS radios, CTCSS was for Baofeng radios, and PL tones were only used by government agencies. Did you also know that Motorola licenses their FRS privacy codes to other manufacturers (so that FRS radios can talk to each other)? No, I'm not making that up.

That's why when "some" new Techs ask about beads I really think they're planning a trip to some jewelry store to help improve their radio's performance. I may have to start making Velocity Factor RF Grease again and take to to various swapmeets where these folks hang out just to watch their faces light up when I explain not to put too much on their coax leads or their signal will overwhelm their buddy's radio down the block (grin).

Even the GROL used to mean something too. No question pools, or correct answer sheets. You had to learn EVERYTHING as you did not know what was going to be on the exam.

I do think the ARRL should look into a 4th license class with FCC support. Maybe a real maintenance or design level version. Make it hard and give it credibility for those that are into the professional side of maintenance/design and programming. A step above just operations or maybe a code class to bring back CW interest.

The CET exams were supposed to take up the slack here.

Jardy,

Remember that's only to be used on "hard-line" to help keep the velocity factor below light speed. By the way, you guys will get a kick out of this ad on Amazon.

Remove the battery from a UV-5R, add a wall-wart/inverter, lay it flat on a table and call it a "business radio" for only $239.95. I fell off my chair when I saw it, so I don't know if that includes free freight or not (LOL).

This batch coming of the MD-380's will be our third run of them. Very nice, well built MotoTrbo compatible radio, but far more $$$ than what your typical Baofeng user wants to pay. I haven't had the time to make up any local code plugs for the radio yet, and with several more shows in the next few weeks I'm not sure that I will anytime soon. Just make sure your customers understand that it's UHF only (not dual-band) and you should be fine.

From: Mike Kelly
Topic: 51635 Message: 51635

Good morning all:
I am having trouble with loading some new freq into the Baofeng radio and wondered if any one could help.
We are going to Nova Scotia this summer and I thought it would be fun to take my Baofeng to listen to some of the repeaters. I am having trouble up loading to the radio.
here’s the steps I used to create the file: 1. Open a new page in Chirp (CTRL-N)2. Click Radio – Input From Data Source - RepeaterBook3. Choose State: Nova Scotia, County: All, Band 2M4. Click OK to import - it imports as a .CVS file
I was able to save the file as NS.CSV to my computer. I then was able to open the file in Chrip. But it would not let me up load to the radio (Baofeng UV-5R). I checked it and all of the files I have that upload or down load to the radio are XX.IMG files. Is there away to convert the .CSV file to a .IMG file or do I need to do something to the .CSV file to allow me to up load it to the radio.
Thanks for your help. Mike Kelly AA6MK

There is always the Ed Fong dual band roll-up antennas on ebay for $25. I have a couple and they work really well. I am guessing you do not mean the tape measure yagi as they are not dual band.

This album has 1 photo and will be available on OneDrive until 10/20/2015.

It has a few strange quirks documented on Miklor but nothing serious at all.

You cannot be it for the price it is very loud just like the MP600 series. The only complaint is the usually factory software and problems with .dat files. The programming is more time consuming without the editing tools found in Chirp or RTS.

Most likely Chirp will support this model as it is on the support request list.

To date this is the BEST Dualband mobile (for the price) on the market.

Once this has better software support these will most likely sell as hot cakes. We took them a step further building these man pack, solar and offroad weatherproof systems for hard use.

IF ANYONE HAS A GOOD TAPE MEASURE STYLED DUAL BAND UHF/VHF antenna design please pass on to me. I am using telescopic antennas now with a spring base. The idea is to keep it portable enough to be carried around easily without the antenna being bent or broken. So far my antenna design for a military style antenna (PRC style) seems to be best for single band use requiring switching antennas between uhf/vhf

If anyone wants more pictures Email me

You need to "copy" those channels to an image downloaded from your radio. CHIRP doesn't know what radio a new tab is for.

You know that might be what is needed. I was thinking of a switch to select an antenna depending on band but it might just be better to use this design that is flexible.

thks

Sure there's a dual-band tape measure antenna - it's really just two yagis tied together.

There is always the Ed Fong dual band roll-up antennas on ebay for $25. I have a couple and they work really well. I am guessing you do not mean the tape measure yagi as they are not dual band.

Yes I have them here is my mini setup in a portable manpack config

KYT 8900 manpack
VIEW SLIDE SHOW DOWNLOAD ALL

This album has 1 photo and will be available on OneDrive until 10/20/2015.

It has a few strange quirks documented on Miklor but nothing serious at all.

You cannot be it for the price it is very loud just like the MP600 series. The only complaint is the usually factory software and problems with .dat files. The programming is more time consuming without the editing tools found in Chirp or RTS.

Most likely Chirp will support this model as it is on the support request list.

To date this is the BEST Dualband mobile (for the price) on the market.

Once this has better software support these will most likely sell as hot cakes. We took them a step further building these man pack, solar and offroad weatherproof systems for hard use.

IF ANYONE HAS A GOOD TAPE MEASURE STYLED DUAL BAND UHF/VHF antenna design please pass on to me. I am using telescopic antennas now with a spring base. The idea is to keep it portable enough to be carried around easily without the antenna being bent or broken. So far my antenna design for a military style antenna (PRC style) seems to be best for single band use requiring switching antennas between uhf/vhf

Nope. The miklor.com site only provides the v3.2.0.0 driver that is compatible with all Prolific type chips. The v3.6.78.350 driver was either automatically installed by windows (likely) or acquired from somewhere else and installed (unlikely). I would expect that once you install and select the v3.2.0.0 driver, you issues will go away.

There's also this one which isn't for dual transmit since the elements are aligned but only uses one PVC pipe so would be a bit lighter.

Subject: [baofeng_uv5r] Uploading to the Baofeng

Good morning all:
I am having trouble with loading some new freq into the Baofeng radio and wondered if any one could help.
We are going to Nova Scotia this summer and I thought it would be fun to take my Baofeng to listen to some of the repeaters. I am having trouble up loading to the radio.
here’s the steps I used to create the file: 1. Open a new page in Chirp (CTRL-N)2. Click Radio – Input From Data Source - RepeaterBook3. Choose State: Nova Scotia, County: All, Band 2M4. Click OK to import - it imports as a .CVS file
I was able to save the file as NS.CSV to my computer. I then was able to open the file in Chrip. But it would not let me up load to the radio (Baofeng UV-5R). I checked it and all of the files I have that upload or down load to the radio are XX.IMG files. Is there away to convert the .CSV file to a .IMG file or do I need to do something to the .CSV file to allow me to up load it to the radio.
Thanks for your help. Mike Kelly AA6MK

How about looking in the files area of this group?

There is a file called "UK_basidvimg" in the "Files" -> "REPEATER and FREQUENCY LISTS - CHIRP image and VIP dat file"
-> "UNITED KINGDOM - Frequency Lists" folder with the description of "CHIRP 281 prior - file with UK 2m and 70cm repeaters, pmr, and frs channels programmed"

Just be sure to either...

1. import it into a tab for your radio
or
2. load it into a second tab and copy and paste it to a tab for your radio

Do not try to directly import it into your radio (if you are using a recent daily build you won't be able to anyway).

In Control Panel / Programs and features/ it is reported as Prolific 3.2.0.0, the other version numbers I took from the Device Manager.

So, thinking I am current.

I did get this from Mikor and it brought me success with TH-F6A when other drivers would not go...

For what it’s worth, I just did a 5 minute key down test of the KT8900 into a Bird 612.
Power stayed solid at 25W the whole time.
The case got a little warm, but definitely not hot.
As long as it’s in a vented area, it should be fine.

They DO get hot but the mini case has the TYT/Zastone th9000 /Mp600 heat sink fins on it.
If you use really long QSO xmt cycles heat might need to be monitored or a good fan on it.

I generally talk very short periods so have not found heat to be an issue for me. I even ran it on a solar panel during field day and 4th of July weekend in 90F heat. Held up real well.

The metal can we used has a good top vent for the manpack and the heat sink is further enhanced with contact on the 30 cal ammo can.
I might put a toggle switch and a modem fan on it- if heat becomes an issue or offer it as an option.

Maybe some thermal compound too if needed.

So far so good but it does get warm.

51647. UV-5R backlight

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-22 23:56:44 UTC
From: stanwhite_snr@...
Topic: 51647 Message: 51647

Greetings,

Noticed something odd with the backlight.

Firmware NSR2407, and using Chirp to set backlight to 20 seconds.

Enter menu, and after a few seconds (even pressing keys) the backlight goes out, and will not come on again, even after exiting the menu, and transmitting/receiving/standby.

I discovered that you can make it work again by switching the radio off, and back on again. I also noticed that switching from memory to VFO and back again made it work.

I used Chirp to set to 9 seconds, and all was ok, with the backlight staying on through the menus all the time I was pressing keys. I.e. it worked normally. I then set 10 seconds from the keypad and all was well.

I am guessing this is not a Chirp issue, as the radio does as it is told by Chirp. Even with 20 seconds set, all is well providing you don't go in the menu. Basically, the radio offers up to 10 seconds and all is OK, Chirp offers more, and the radio misbehaves.

Anyone else seen this behaviour?

Regards and 73,

Stan, G4EGH

That’s good 5min test would uncover a heat issue for sure. Some blowhards here in my area might talk non-stop for 5m on a repeater so it is good to know they will hold up well.

Looks like one of the Anytone copies tri-band at 350 mhz same channel cap

We only use the 300 mhz band for ISR military frequencies for Air patrol and reserve units here, Nobody else can use it

The original UV-5R menu allowed ABR settings of OFF, 1-5. The newer radios allow ABR settings of OFF, 1-10.

The OEM software allows ABR settings of OFF, 1-5.

It was just noticed when programming CHIRP that the radio seemed to accept values up to 24 so CHIRP was written to accept and set the values that high. If you don't like the behavior that you get when using values above 10, don't set it above 10.

Note however a few facts:

1) The FCC does not regulate receivers. The preemption applies to amateur radio transmitters (transceivers) but not to separate receivers even if you claim it is part of your amateur radio station. So your ham radio is covered, but a regular scanner is not.

2) Even if the preemption applies in your specific case, it WILL NOT prevent the cop from stopping you and giving you a ticket -- or arresting you and confiscating your radio. You MAY win the case in court eventually, but only after spending time and money to have a lawyer convince the court that this ruling by a federal agency supersedes their state law. Once you win the criminal case, THEN you get to sue the state for the return of your radio - which will have already been destroyed, "lost", or sold - so then you get to take the local police department back to court a third time to try to collect the value of your used radio (which is about 1% of the cost of having your lawyer file the suit).

Not if you explain nicely that you're a amateur radio operator, the radio is a ham radio and that the hands free law exempts amateur radio. Then offer to show him your license and a copy of the law. If he writes a ticket anyway or tries "resisting" arrest, you have him in court. You might even get to see the judge chew him out.

Notice it says using the device to commit a crime. If you're not committing a crime, you can use it. That was a change from the old scanner law where having a scanner or device that could receive those frequencies in your car was illegal. Even a person buying one at Radio Shack and taking it home by car violated that law. One local ham who was also on the rescue squad got a ticket while he was trying to track some one who was jamming police frequencies. When the law changed, the judge threw the case out.

Just received 2 UV5+Plus and one UV-5RV2+. All three radios have N5R2407 and BFB297 firmware. After download of radio I uploaded my current program which did not have this firmware. Now no receive. Went to many sites that gave same advice and followed same. No joy. Can not get receive after hours of following instructions and suggestions. Yes, I did copy my program over to the downloaded program.
I may not be the only one with this problem. Help would be appreciated. Tnx, Mac

Kevin:
I know this is OT, very few people have a grasp of how true the statement in your signature is. So many companies made scrappy am receivers. This gave the impression AM is scrappy.
Just my two cents.

Actually the FCC does regulate receivers. Read part 15.

Note however a few facts: 1) The FCC does not regulate receivers. The preemption applies to amateur radio transmitters (transceivers) but not to separate receivers even if you claim it is part of your amateur radio station. So your ham radio is covered, but a regular scanner is not. 2) Even if the preemption applies in your specific case, it WILL NOT prevent the cop from stopping you and giving you a ticket -- or arresting you and confiscating your radio. You MAY win the case in court eventually, but only after spending time and money to have a lawyer convince the court that this ruling by a federal agency supersedes their state law. Once you win the criminal case, THEN you get to sue the state for the return of your radio - which will have already been destroyed, "lost", or sold - so then you get to take the local police department back to court a third time to try to collect the value of your used radio (which is about 1% of the cost of having your lawyer file the suit). I'm sorry guys. My reference was not the Star Trek episode. It was the AM fidelity statement in Kevin's signature. City on the edge of forever is my favorite episode. Harlan Ellison wrote some good stuff for The Outer Limits too. Those two TV showed sparked my interest in computers and electronics.

Sorry, but YOU need to read Part 15 again -- actually read it this time. NOTHING in Part 15 regulates the receiving, the technical specifications that apply to receivers are for the RF that they emit as "Unintentional Radiators" i.e. the RF that gets transmitted by the receiver. These are the same technical requirements that apply to computers, monitors, fluorescent lights, and other devices that are not intended to be transmitters but which do radiate RF.

If a radio has a scanning function, then further rules apply as a "scanning receiver" As a matter of fact, the FCC ID on many amateur transceivers, when looked up at the FCC website, show them as a "Part 15 Scanning receiver" Further rules apply:
? 15.121 Scanning receivers and frequency converters used with scanning receivers.
(a) Except as provided in paragraph (c) of this section, scanning receivers and frequency converters designed or marketed for use with scanning receivers, shall: (1) Be incapable of operating (tuning), or readily being altered by the user to operate, within the frequency bands allocated to the Cellular Radiotelephone Service in part 22 of this chapter (cellular telephone bands). Scanning receivers capable of ?readily being altered by the user? include, but are not limited to, those for which the ability to receive transmissions in the cellular telephone bands can be added by clipping the leads of, or installing, a simple component such as a diode, resistor or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer. Scanning receivers, and frequency converters designed for use with scanning receivers, also shall be incapable of converting digital cellular communication transmissions to analog voice audio. (2) Be designed so that the tuning, control and filtering circuitry is inaccessible. The design must be such that any attempts to modify the equipment to receive transmissions from the Cellular Radiotelephone Service likely will render the receiver inoperable. (b) Except as provided in paragraph (c) of this section, scanning receivers shall reject any signals from the Cellular Radiotelephone Service frequency bands that are 38 dB or lower based upon a 12 dB SINAD measurement, which is considered the threshold where a signal can be clearly discerned from any interference that may be present. (c) Scanning receivers and frequency converters designed or marketed for use with scanning receivers, are not subject to the requirements of paragraphs (a) and (b) of this section provided that they are manufactured exclusively for, and marketed exclusively to, entities described in 18 U.S.C. 2512(2), or are marketed exclusively as test equipment pursuant to ?15.3(dd). (d) Modification of a scanning receiver to receive transmissions from Cellular Radiotelephone Service frequency bands will be considered to constitute manufacture of such equipment. This includes any individual, individuals, entity or organization that modifies one or more scanners. Any modification to a scanning receiver to receive transmissions from the Cellular Radiotelephone Service frequency bands voids the certification of the scanning receiver, regardless of the date of manufacture of the original unit. In addition, the provisions of ?15.23 shall not be interpreted as permitting modification of a scanning receiver to receiver Cellular Radiotelephone Service transmissions. (e) Scanning receivers and frequency converters designed for use with scanning receivers shall not be assembled from kits or marketed in kit form unless they comply with the requirements in paragraph (a) through (c) of this section. (f) Scanning receivers shall have a label permanently affixed to the product, and this label shall be readily visible to the purchaser at the time of purchase. The label shall read as follows: WARNING: MODIFICATION OF THIS DEVICE TO RECEIVE CELLULAR RADIOTELEPHONE SERVICE SIGNALS IS PROHIBITED UNDER FCC RULES AND FEDERAL LAW.(1) ?Permanently affixed? means that the label is etched, engraved, stamped, silkscreened, indelible printed or otherwise permanently marked on a permanently attached part of the equipment or on a nameplate of metal, plastic or other material fastened to the equipment by welding, riveting, or permanent adhesive.

The label shall be designed to last the expected lifetime of the equipment in the environment in which the equipment may be operated and must not be readily detachable. The label shall not be a stick-on, paper label. (2) When the device is so small that it is not practicable to place the warning label on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user and shall also be placed on the container in which the device is marketed. However, the FCC identifier must be displayed on the device. [64 FR 22561, Apr. 27, 1999, as amended at 66 FR 32582, June 15, 2001]

Which is a common request of idiots at our table

“Do you have anything that can scan the Cell phone bands?”

Last show DHS was going around trying to buy Green and Blue HP lasers. After finding none and looking for potential pawned military equipment being sold by vendors they showed up in our corner wanting these type of scanners.

Too bad they cannot put those assets at good use along our open borders or investigating possible Jihadi types that want to shoot up the PC gun free zones- recruiting stations.

Subject: Re: [baofeng_uv5r] Is it illegal to hold a portable ham radio/scanner in a car in NJ

If a radio has a scanning function, then further rules apply as a "scanning receiver" As a matter of fact, the FCC ID on many amateur transceivers, when looked up at the FCC website, show them as a "Part 15 Scanning receiver" Further rules apply:
? 15.121 Scanning receivers and frequency converters used with scanning receivers.
(a) Except as provided in paragraph (c) of this section, scanning receivers and frequency converters designed or marketed for use with scanning receivers, shall:
(1) Be incapable of operating (tuning), or readily being altered by the user to operate, within the frequency bands allocated to the Cellular Radiotelephone Service in part 22 of this chapter (cellular telephone bands). Scanning receivers capable of ?readily being altered by the user? include, but are not limited to, those for which the ability to receive transmissions in the cellular telephone bands can be added by clipping the leads of, or installing, a simple component such as a diode, resistor or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer. Scanning receivers, and frequency converters designed for use with scanning receivers, also shall be incapable of converting digital cellular communication transmissions to analog voice audio.
(2) Be designed so that the tuning, control and filtering circuitry is inaccessible. The design must be such that any attempts to modify the equipment to receive transmissions from the Cellular Radiotelephone Service likely will render the receiver inoperable.
(b) Except as provided in paragraph (c) of this section, scanning receivers shall reject any signals from the Cellular Radiotelephone Service frequency bands that are 38 dB or lower based upon a 12 dB SINAD measurement, which is considered the threshold where a signal can be clearly discerned from any interference that may be present.
(c) Scanning receivers and frequency converters designed or marketed for use with scanning receivers, are not subject to the requirements of paragraphs (a) and (b) of this section provided that they are manufactured exclusively for, and marketed exclusively to, entities described in 18 U.S.C. 2512(2), or are marketed exclusively as test equipment pursuant to ?15.3(dd).

(d) Modification of a scanning receiver to receive transmissions from Cellular Radiotelephone Service frequency bands will be considered to constitute manufacture of such equipment. This includes any individual, individuals, entity or organization that modifies one or more scanners. Any modification to a scanning receiver to receive transmissions from the Cellular Radiotelephone Service frequency bands voids the certification of the scanning receiver, regardless of the date of manufacture of the original unit. In addition, the provisions of ?15.23 shall not be interpreted as permitting modification of a scanning receiver to receiver Cellular Radiotelephone Service transmissions.
(e) Scanning receivers and frequency converters designed for use with scanning receivers shall not be assembled from kits or marketed in kit form unless they comply with the requirements in paragraph (a) through (c) of this section.
(f) Scanning receivers shall have a label permanently affixed to the product, and this label shall be readily visible to the purchaser at the time of purchase. The label shall read as follows: WARNING: MODIFICATION OF THIS DEVICE TO RECEIVE CELLULAR RADIOTELEPHONE SERVICE SIGNALS IS PROHIBITED UNDER FCC RULES AND FEDERAL LAW.
(1) ?Permanently affixed? means that the label is etched, engraved, stamped, silkscreened, indelible printed or otherwise permanently marked on a permanently attached part of the equipment or on a nameplate of metal, plastic or other material fastened to the equipment by welding, riveting, or permanent adhesive. The label shall be designed to last the expected lifetime of the equipment in the environment in which the equipment may be operated and must not be readily detachable. The label shall not be a stick-on, paper label.
(2) When the device is so small that it is not practicable to place the warning label on it, the information required by this paragraph shall be placed in a prominent location in the instruction manual or pamphlet supplied to the user and shall also be placed on the container in which the device is marketed. However, the FCC identifier must be displayed on the device.

That's because and amateur radio, per se, doesn't require an FCC ID, and in fact there isn't any way to get an FCC ID number _as_ an amateur radio. The 15.121 simply implements the outdated and useless federal law against scanners that cover cell phone frequencies.

51697. I broke my UV-5R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-25 23:53:46 UTC
From: Michael D Earls
Topic: 51697 Message: 51697

I had been procrastinating trying to solve the erratic volume problem I was having.

I finally disassembled the radio to see if it provided better access to use contact cleaner on the volume.

It didn't. I gave the volume shaft a couple of shots of plastic safe contact cleaner, after using a piece of foil to protect the rest of the radio.

The volume issue may be cured, but after reassembling the radio, the CALL, PTT, and MONI buttons no longer work.

With the chassis out of the case and antenna installed, I held the battery in place and confirmed that all three buttons on the chassis work fine.

Somehow, the rubber pads are not engaging the buttons. I see nothing wrong with the pads or their function.

Have reassembled it several more times with no luck.

I believe the group photos area at one time had pictures to show how to disassemble and assemble these radios. You may take a look and see what you can find.

Jim, thanks.

I found nothing in the files or photos sections.

This is the video I originally went by.

https://www.youtube.com/watch?v=bVO6-DajyjQ

I found this one and the answer begins at 13:00 minutes.

https://www.youtube.com/watch?v=uvRocFQHOy0

He included in his tools list a long, thin blade, in his case a utility knife with the snap off sections.

He explains that the chassis can push the rubber out of alignment so that the buttons don't function.

He uses the blade to hold the rubber in place while inserting the chassis.

Can't try it until I get a suitable blade.

I tried this using the thin blade on my small Swiss army knife.

On the first attempt, the CALL and PTT worked but not the MONI.

I tried again and the MONI and PTT worked but not the CALL.

It occurs to me that a long feeler gauge would be ideal for this.

I don't have one handy.

If you told that to Mr Ellison how you liked that episode, you might make him mad. Yes, he had screen writing credit, but I believe Gene Roddenberry re-wrote the story enough to get Harlan mad about it. Key point is how McCoy got injected and goes crazy. The original story line had Scotty making a home brew beverage which made McCoy go crazy.

I'm sorry guys. My reference was not the Star Trek episode. It was the AM fidelity statement in Kevin's signature. City on the edge of forever is my favorite episode. Harlan Ellison wrote some good stuff for The Outer Limits too. Those two TV showed sparked my interest in computers and electronics.

Was informed VERY SLOW production in China, some lines and companies are starting layoff’s. Some concern about stock losses and a shortage of accessories and parts are not helping.

Was also informed that Baofeng and some Asian based dealers are dumping their radio stockpile, prices as low as $15 (offered to Chinese based buyers) so there is a good chance you can find one for $30 or under.

Oh I forgot, this Chinese contact stated the return rates for these batches being discounted is over 15% defective so they will not participate in getting the discounted radios.

They also stated on the Chinese side they do not like doing biz with Baofeng over quality control issues and low profit margins but carry the Baofeng product line as customers often request this version.

You are probably right. I've read in a couple of books that Roddenberry was a bit of a jerk. Harlan took a jab at him when he won an award. I don't remember the exact quote. " This is what happens when they don't mess with your writing. " Something along those lines. Gene wrote words to the theme music just to share in the creation rights. Would be interesting to see the episode as it was written.

You may find a flaw in the latest release of Chirp software, allowing
you to use your Baofeng UV5r to keep in contact with the
Kobayashi Maru using simplex distress frequencies. As such, you
can bypass the simulation software, and save the Kobayashi Maru.

But, it's only found on the latest release. Might need to download
Klingon 2.04 from your HT before doing this.

Except the NA-771 exceeds the 9" maximum length specified by the original poster.

Which post were you reading Scott? There were only two requirements:

1. Better than the stock [A-5R Logo] antenna
2. No longer than 9 inches

I don't see where that is "looking for the holy grail in antennas".

The A-V85s are all over Amazon and ebay. Easily found for about $5 or less and they work great. The new Nagoya NA717 is really good if you want something very flexible (can bend 270 degrees without harm) and the same size and performance but at about $16. The nice thing is they have a very short base so they start flexing less than an inch above the mount unlike the V85 whihc starts several inches up and is more stiff.

First off I have to say Nice reply Jardy. Took you all of what like 30 sec to say "Look at the Miklor site?"

Come on... Why be a smart ass when you can take just a little time and just lend a helping hand. You must have had one dick for an Elmer.

WB8YQJ

,

I get where you're coming from. Most likely you've already read the Miklor site, and even did some research.

You're most likely asking "which one would you use"?

You can look all ALL day long at specs and reviews, but they only go so far. I have to agree with others, in that the A-V85 antenna really rocks. Durable, seems to work quite well, has good transmit and receive. I get mine here...

Original Baofeng SMA-Female 18CM Dual Band Antenna for Baofeng UV-5R/UV-82/GT-3 Two-way Radio - Baofeng - Antenna - Radio Accessories Two-Way Radio, Accessories | Radioddity http://www.radioddity.com/us/radio-accessories/antenna/baofeng/original-baofeng-sma-female-18cm-high-gain-dualband-antenna.html

My second choice for antenna is the Nagoya 701. The only problem is, with the UV-5R's, I have to put a little rubber O-Ring at the base, to take the stress off the connector and to basically "dress it up" a little. As to actual "real world" performance? They are both on par with each other. The 701 does perform a little better, but I've actually broke two of them dropping radios, yet the V85 has been dropped quite a few times with no degradation.

Anyone can point you to the Miklor site, and anyone can say look at the specs, but I think you're looking at a more personal recommendation.

Another vender I use is http://www.buytwowayradios.com http://www.buytwowayradios.com

Their site is a little tricky to navigate to get to the Amateur Radio accessories, but they do have good stuff.

The Miklor site has a lot of information on different antennas and what is good and bad about them. Without knowing the circumstances the gentleman is trying to work under, there is no way of knowing what he actually wants. This is the reason for the other guy's "holy grail" comment. By referring to the web site, he can read the research and figure out for himself what might work for him. I do just fine with the antennas that came with my 3 Baofengs. The other refences made here just gives a make and model, but no particulars on why they like the antenna. I help a lot of hams locally, but I try to get them to help themselves first by pointing them in the right direction. I feel my response was appropriate to the situation, given the information or lack of, involved in the question. So, you can just bite me. Thank you very much.

51736. Critical info about accessories

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-27 02:37:14 UTC
From: R Pryor MAEd CETsr
Topic: 51697 Message: 51736

Had some important calls and info coming from Chinese companies and people on the ground over there. This info will be passed to a select few for what it is worth.
For the rest of the group, I highly suggest buying any ACCESSORIES NOW!
This is for all Chinese made radios not just uv5R’s.
This is especially for Li-on batteries and other items.
Shortages and some changes are coming and it doesn’t sound good as of right now.

51737. Re: [baofeng_uv5r] Re: Need UV-5R Antenna recommendation!

Hi Jardy,

Wondering how you could possibly glean this from my original question, you might be surprised to know how much I know about antennas and how much research I have done.

One thing that kept coming back in the reviews was that the UV5R ships with a substandard 4.5 inch antenna. That's fine, for the price I can accept that.

So I was wanting to know, since I like the form factor of that antenna, what would be the minimum amount of extra length I would have to accept, and the minimum cost that I could pay to remedy the problem stock antenna with a baseline dual band performer.

That seemed like a fair question for the reflector, actually a high value for "on topic".

The answer I am going with is "Baofeng makes a very slightly longer antenna that remedies the stock antenna problems and you can get one on Amazon for six bucks delivered".

We'll see if it works, I ordered an A-V85 today. As long as it works as well as the many dual band ducks I have here at present I'll be satisfied.

I appreciate all the responses and everyone will forget about any controversy by tomorrow or the day after, pretty sure. ;-)

Hello

Actually the A V85 antenna has been shipped by default on some of the versions since the beginning of the year. Even the smaller Pofung boxes have the plastic insert trays cut sideways for the V85 antenna.

The last rubber ducky rounded version I saw came around Dec of 2014. You might want to check a few suppliers and see if you are getting the newer versions. It used to be the luck of what they put in the box, now the Uv5R TP Tri-powers, the Part90 versions I got in and the Zastone ZT 8W HP versions all come with the V85.

They also are standard for the new Uv82’s both HP versions being sold and a similar one for the 220 mhz version too.

If you did all the research you claim to have done, it seems reasonable to me that one of the places you would have looked at would have been the Miklor site. The FAQs and website links are included in each and every email I get from this Yahoo group. There was no information about your particular needs, such as being in the middle of no where 25 miles from the nearest repeater or being 1/2 mile away from a high rf site that is overwhelming your radio. Did you want a mobile antenna? The research done on the website covers most of the situations someone can run across. The research you claimed to have done should have answered the question by itself. Just my opinion.

Thank you.

Had some important calls and info coming from Chinese companies and people on the ground over there. This info will be passed to a select few for what it is worth. For the rest of the group, I highly suggest buying any ACCESSORIES NOW! This is for all Chinese made radios not just uv5R’s. This is especially for Li-on batteries and other items. Shortages and some changes are coming and it doesn’t sound good as of right now.

Buy them, factories are shutting lines down, part shortages, laying off workers, some suppliers got slammed in the stock market crash over there. Some talk about major players switching their focus to other products, mergers and some going out of business.

A few new radio manu’s have scrapped some of their R &D for new models too.

Lots of complaints about Baofeng too.

Get what you can now until things turn around, also expect shortages on Amazon to start due to component manu’s not getting parts in to complete products. Part suppliers focusing on a business model of low cost high volume sales are facing the same low cost demand with low profit margins AND low volume demand. They are running short and starting cutbacks.

Most likely some will be getting bailouts from the Chinese Government to stay afloat through this period.

Yes

Get the small box versions that are marked Pofung on the box instead of the older bigger boxes that say Baofeng. Those small boxes are fitted with a cutout of the V85 antenna that runs diagonally in the box.

Those boxes have no preform for the rounded older ducks anymore.

Subject: Re: [baofeng_uv5r] Re: Need UV-5R Antenna recommendation!

Actually the A V85 antenna has been shipped by default on some of the versions since the beginning of the year.

That is super good news because I ordered a second UV5R direct, maybe will get lucky...

Jardy,

You must have missed it in my post. I offered two recommendations on antennas AND even told him how to "fill in the gap" which the 701 leaves on the radio when putting it on.

He gave PLENTY of information in his question. Less than 9", better than stock, and reasonably priced. How hard could it be to not see that he is asking for an opinion on what you may use and what would work for him?
And bite you??? Really??? 6th grade playground insults???

OK... then you're still a tool.

Whatever. Question asked and answered numerous times. Anybody body that did even a little research can find the info readily available in the FAQs, the Miklor site, and under conversations on the Yahoo group site. So I am a tool. Big deal.

It would also be useful to include a snippet of the conversation one is responding to. There are so many responses under the same subject matter that things can get mixed up. Take that as you wish.

"So I am a tool. Big deal."

Jardy, I don't think you are, but at least take some comfort that you're an American tool and not some cheaply made Chinese import tool (insert laughter here).

With the way the Chinese (and some dealers) take liberties with their marketing materials, I won't be surprised to see somebody announce a "twenty-band" HT soon, with band specs like 136-146, 146-156, 156-166, 166-176, 350-360, 360-370, 380-390, 390-400, 400-410, 410-420, 420-430, 430-440, 440-450, 450-460, 460-470, 470-480, 480-490, 490-500, 500-510, and 510-520 MHz.

They are not even available in a Maplin store - a web only product!

The UK based company I use to buy them from are 23.49 this week, they claim they will charge for shipping but never do.

www.baofengradio.co.uk

Last week they were cheaper

Radio Shack closed hundreds of stores, filed bankruptcy, and a much smaller version of what was left was then purchased by Sprint.

It seems that many Americans would go to their stores, check out the product(s) they had in stock, ask loads of tech questions, and then rush home to Google the lowest price(s) they could find on the product(s) they wanted from a website warehouse like Amazon.

Apparently Radio Shack couldn't find U.S. based employees that would work for free (or at least minimum wage, or even better, for Chinese level wages), was unable to find retail store locations for next to nothing or lease retail space for warehouse rates, or even ignore state, local and federal taxes (which Amazon has done for years by claiming their corporate location is located in some tiny tax-haven country in Europe), but I'm sure the European's support their local businesses much better than American's do, right?

I am an avid builder and restorer of old equipment. I like a lot of my friends doing the same thing don't go running down to Radio Shack to buy one resistor at a time. I buy resistors 100 at a time of the same value. So do my other hobby friends. These days I keep in stock more parts then Radio Shack carried in one store. I am a hobbyist and don't work on radios for income. I also need mainly parts they didn't stock. Guys like me didn't need Radio Shack. Advice, I like many hams didn't need Radio Shack for advice. Radio Shack could only sell to the guy needing simple parts very infrequently. They had to charge high prices to cover their overhead. In short there were not enough of these infrequent buyers to sell things to to cover their rent. Guys like me can order parts on the internet and have them delivered in a day or two. The bottom line is Radio Shack's business model was obsolete. You can't have a store on every corner selling a resistor or capacitor once in awhile. They could not pay higher wages because they didn't have enough buyers to make enough profit to pay higher wages. Nobody needed them for audio equipment or for cellphones either.

From: Christopher Young
Topic: 51752 Message: 51766

RS has changed a LOT since the seventies when I first was in one of their stores. Used to be they had the vacuum tube tester in the back corner, and plenty of radio parts. No more tube testers (probably in the cellars of the managers of that era). Fewer parts, and lacking a lot of the old things I used to buy.

We'd be pleased to send the stores, but there likely will be no resupply. Their prices are higher than I can find else where.

Used to be able to go to RS and buy enough electronic parts to build a radio, now you have trouble buying coax.

We had them in Oz as well, but they were always overpriced and seemed to stock far less components than their major competitor at the time (Dick Smith Electronics). RS is long gone now. Dick Smith got bought out by Woolworths and is more of a tech geek shop now, pretty much out of components. Jaycar seem to be the major supplier in that area now, they also carry kits of one kind or another. Don’t deal with Amazon at all, too much trouble and too expensive – I buy my Baofengs direct from China usually, or Hong Kong (which is China of course but there are subtle differences).

Actually they made some real stupid business decisions like trying to be a cell phone when the market was saturated with them, dumping some product lines while there was still a demand for them and almost eliminating the DIYer parts when a lot of people need them, not a week later like eBay. Even though parts never made a lot of money, they were the largest markup items for the stores. Include salespeople who didn't know their products.

When I first started visiting Radio Shack in the Sixties, most of the employees were what one could consider Elmers. They had a lot of DIY knowledge that they were happy to pass along. I also fondly remember the free batteries we could get every month with our Radio Shack battery card. It helped lessen the cost of my brilliant electronics projects.
Radio Shack had their own line of computers, I still have my Tandy Model 102, an amazing machine back in its day.
However, the cell phone salesmen took over and that business model pretty much ended them.
I am lucky, for some reason, my small Southern California town has two Radio Shacks in town. They are mostly cell phone, but do have a corner where I can pick up some electronic parts.
I do miss the old DIY version of Radio Shack.

I just purchased the Baofeng F8HP and got it all set up. Frequencies and offsets were working find in
Channel Mode. Now, for some reason, all Memories will not transmit but in simplex mode?

I deleted a Channel, then re-programmed and saved the new entry with the minus offset. However,
the offset is still not working on any of the memory channels.

Any idea what I did to cause this? (I have a cable on order and next programming will be with Chirp)

Thanks

Yes I did. Like I stated, it was working fine and I think I must of hit a combination of keys and all my offsets disappeared. Of course, in Frequency mode, they work fine.

I think I can do a reset and start over but I'll wait for the cable to arrive.

I didn't see anyone else having this problem and wondered if anyone did.

Thanks for your reply, Jerry.

Absolutely no doubt that Radio Shack management made many dumb decisions, including leasing out store spaces within a few miles of one another and trying to enter the cell phone craze way too late and with no real market advantage vs. the carrier's stores.

Having said that however, consumer's shopping habits certainly didn't help them at all. Radio Shack was much more successful in year's past by having their own products under their own private labeling, which greatly reduced the consumer's ability to pop into the local store, test the product(s), ask their pre-sales question(s) and then search for the lowest price on-line (sometimes while still standing at the Radio Shack store scanning the item(s) with their smart phone app). You could not, for example, purchase a Radio Shack portable computer at Best Buy at a lower price because Radio Shack would not ship them any, even if they asked.

That same no-loyalty prospect issue affects virtually all store owners today, some are just large enough to get the manufacturers to either slightly alter a part number or change the UPC sticker to something specific to their store (which at least cuts down on the issue of the prospect using his or her smartphone to scan a UPC code and find Amazon selling it for less - all with zero customer time investment or local store location/tax issues).

That's precisely why some radio dealers are now getting the manufacturer(s) to modify face plates, alter part numbers, introduce a "new" manual, or slightly modify a product's spec in order to claim their product is unique (and therefore by definition, harder to source elsewhere and worth more money). Frankly, I don't blame them one bit.

I remember a very good dealer source (Kurt from Three Old Crows in Texas) that used to frequent this forum and answer many questions. Time after time I read one user after another make the same remark about supporting a local (or at least a U.S. based dealer) only to read weeks later that same user tell us about finding the product at a different source (almost always based in China or on Amazon) for less money. I even remember Kurt asking once what percentage (above the lowest cost on the planet) a particular end-user was willing to pay to support the local dealer. I believe the answer was something akin to $1 or less. Anything more than that was apparently just too much for that user, I guess. I don't think it was too long after that incident when Kurt decided he was going to have a "going out of business" sale, since his overhead and inventory costs would never justify a $1 difference between his store prices and some hut in China using Amazon's FBA procedures.

Other dealers pre-order product(s), test and configure the product(s), and even travel to various shows to introduce the prospects to the product(s),

and are usually met with the same type of response, "but I can purchase this XX product for less on E-Bay, Amazon, or wherever". It probably never even occurs to them that just 30 minutes before that they either didn't know that product existed or didn't know what it could do (until that local dealer took the time to educate them).

Now before you think I'm just picking on someone on this forum while they are trying to get the best "deal", this "not shopping local issue unless it's also the lowest price I can find" affects schools, local and state governments, etc., etc. I can't tell you how many times our local school district asks for more and more funding, yet they have zero issue buying the vast majority of their supplies out of state. The same is true at the local and state government levels. Well, this may be a shock to some, but if the local business community's sales are in the dumps, it will be really hard to see additional taxes pouring into school funding, or state/local budgets (or even hiring or expanding staff levels and reducing the local unemployment rate).

These radios don't use offsets in MR (channel) mode. They store the RX frequency and the TX frequency.

To change a repeater channel to a simplex channel is possible. You would have to reprogram the TX frequency to be the same as the programmed RX frequency. I don't know of any way of doing that except for one channel at a time.

Or simply programme the frequencies, and adjust the CTCSS to suit your
location.

I bought a few things from Dick Smith before they went; good quality
products at a good price. I see Jaycar is run by a former DS man; I'll
have a root through their lists.

My state requires "lowest bid" for anything a school buys. Unfortunately there are so many ways around that and some companies refuse to put in a bid. And with some districts paying late where the companies books have to remain open for more than a year, they bump up the price. Having been in the classroom for over 35 years, I hope that's not how other businesses are run.

> That same no-loyalty prospect issue affects virtually all store owners today, some are just large enough to get the manufacturers to either slightly alter a part number or change the UPC sticker to something specific to their store (which at least cuts down on the issue of the prospect using his or her smartphone to scan a UPC code and find Amazon selling it for less - all with zero customer time investment or local store location/tax issues).
>
> That's precisely why some radio dealers are now getting the manufacturer(s) to modify face plates, alter part numbers, introduce a "new" manual, or slightly modify a product's spec in order to claim their product is unique (and therefore by definition, harder to source elsewhere and worth more money). Frankly, I don't blame them one bit.
>
> I remember a very good dealer source (Kurt from Three Old Crows in Texas) that used to frequent this forum and answer many questions. Time after time I read one user after another make the same remark about supporting a local (or at least a U.S. based dealer) only to read weeks later that same user tell us about finding the product at a different source (almost always based in China or on Amazon) for less money. I even remember Kurt asking once what percentage (above the lowest cost on the planet) a particular end-user was willing to pay to support the local dealer. I believe the answer was something akin to $1 or less. Anything more than that was apparently just too much for that user, I guess. I don't think it was too long after that incident when Kurt decided he was going to have a "going out of business" sale, since his overhead and inventory costs would never justify a $1 difference between his store prices and some hut in China using Amazon's FBA procedures.

>
> Other dealers pre-order product(s), test and configure the product(s), and even travel to various shows to introduce the prospects to the product(s), and are usually met with the same type of response, "but I can purchase this XX product for less on E-Bay, Amazon, or wherever". It probably never even occurs to them that just 30 minutes before that they either didn't know that product existed or didn't know what it could do (until that local dealer took the time to educate them).
>
> Now before you think I'm just picking on someone on this forum while they are trying to get the best "deal", this "not shopping local issue unless it's also the lowest price I can find" affects schools, local and state governments, etc., etc. I can't tell you how many times our local school district asks for more and more funding, yet they have zero issue buying the vast majority of their supplies out of state. The same is true at the local and state government levels. Well, this may be a shock to some, but if the local business community's sales are in the dumps, it will be really hard to see additional taxes pouring into school funding, or state/local budgets (or even hiring or expanding staff levels and reducing the local unemployment rate).

Jim,

Your comment could be confusing, since the other method of programming a memory channel involves setting the shift direction and offset and storing to that channel.

When doing it that way, the TX frequency isn't directly entered.

These radios don't use offsets in MR (channel) mode. They store the RX frequency and the TX frequency.

To change a repeater channel to a simplex channel is possible. You would have to reprogram the TX frequency to be the same as the programmed RX frequency. I don't know of any way of doing that except for one channel at a time.

When I worked for our local water district, we were required to source locally first, if possible. We did pay more in most cases, but not significantly more. Where we did benefit was, we had suppliers locally that knew what we really needed, and they kept plenty of stock around. The public benefited from this also, in various ways, including as some have mentioned, taxes.
I do understand getting the very best deal, as I am now on a fixed budget, but I find it beneath me, and reprehensible, to go into a brick and mortar establishment just to get the look and feel of something, or first hand knowledge of something, and then buy from an online dealer just to save a buck.
I will however, spend plenty of time online researching and buying online, but, in the case of eBay, I will click the button for North American or U.S. sellers only. I am willing to forgo the lowest price, for the speed I get by purchasing items that way.

It's not really using offsets to store the freq. Just to let you easily press the Scan key so you don't have to fat finger the tx freq.

You are doing step 11 to store the transmit freq and you are hearing the audio confirming the storing of BOTH receive at step 9 and transmit at step 11, right?

A memory channel in a UV-5R radio (or one of the many variants) only supports storing an RX frequency and a TX frequency. There are no bits set aside to store a shift direction or offset value because they are not needed. So no matter how you program one of these radios, there are absolutely no shift direction or offset stored in the memory channel.

So the purpose of specifying the shift direction and offset is so that the correct TX frequency is displayed when you reverse?

It was also puzzling because CHIRP does use those.

Incidentally, when I read from the radio after successfully programming a 2m repeater channel, CHIRP showed an offset of 0.601550.

Any idea why?

That indicates the difference between tx and tx freqs indicate a non standard offset for 2M

We have a few here that are this way.

If it is supposed to be 600 khz then recheck your in/out freqs again

I think that is what your asking

That was actually a case where I entered the .600 offset using menu 26 and direction using menu 25 and then hit *reverse to store the TX freq.

I began reading from the radio after my programming attempts to understand what was happening.

That indicates the difference between tx and tx freqs indicate a non standard offset for 2M

We have a few here that are this way.

If it is supposed to be 600 khz then recheck your in/out freqs again

I think that is what your asking

If you guys have spare cash I would seriously look at stocking up on extras like batteries and other items that are made in China. Some serious things going on right now, it is too early to speculate on the information I got but my suggestion is to do this now if you can.

Most likely it will go this way:

1. Some really low prices as some dumping is going on to clear stock – for a short period

2. Shortages will then start right away that- or even now for certain items

3. A supply side shutdown and Supply and Demand models indicating large price increases

FYI some of the major players making these cheap radios, and their part suppliers are going to do this.

1. Change models and merge companies

2 scale back or do product changes – leave the Ham radio market

3. Go completely under

4. Try to raise prices to recoup huge losses in the stock market and worldwide slowdowns.

4. Ask the Chinese Government to assist with some type of bailout to weather the storm.

Our favorite little radios and the company that makes them adopted a biz model based on low costs and high volume with just above costs profit margins. Now suppliers that were forced to provide the parts on the same page are facing trouble. Volume is down and the market price is down this puts the profit margin really low for some of these companies which a few, got hammered in their stocks the last month or so.

Layoffs, production line shutdowns, idle warehouses and the cancelling of new models is going on right now.

Funny thing some of the other competitors despise Baofeng because they feel the company has set the standard for a really cheap radio regardless of cost or capabilities.

They stated that they were forced into keeping their versions as low as possible too. This was to match Baofeng’s model. They also stated they did not like the stigma of radio products made in China to always be cheaply priced and wanted a reputation of being like JP company products.

Also (according to them) some of the recent Baofeng models have a +15% failure rate right out of the box , and profit is as low as $1 per radio.

Some want Baofeng to fail or get knocked out of the market so they can raise prices- very interesting convo here.

BOTTOM LINE I would get spare items for ALL CHINESE radios right now- especially extra batteries.

Subject: Re: [baofeng_uv5r] Re: UV-5R in Maplin (UK)

When I worked for our local water district, we were required to source locally first, if possible. We did pay more in most cases, but not significantly more. Where we did benefit was, we had suppliers locally that knew what we really needed, and they kept plenty of stock around. The public benefited from this also, in various ways, including as some have mentioned, taxes.
I do understand getting the very best deal, as I am now on a fixed budget, but I find it beneath me, and reprehensible, to go into a brick and mortar establishment just to get the look and feel of something, or first hand knowledge of something, and then buy from an online dealer just to save a buck.
I will however, spend plenty of time online researching and buying online, but, in the case of eBay, I will click the button for North American or U.S. sellers only. I am willing to forgo the lowest price, for the speed I get by purchasing items that way.

On Jul 28, 2015, at 3:40, "Craig Carnahan craig.n7lb@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

Absolutely no doubt that Radio Shack management made many dumb decisions, including leasing out store spaces within a few miles of one another and trying to enter the cell phone craze way too late and with no real market advantage vs. the carrier's stores.

Having said that however, consumer's shopping habits certainly didn't help them at all. Radio Shack was much more successful in year's past by having their own products under their own private labeling, which greatly reduced the consumer's ability to pop into the local store, test the product(s), ask their pre-sales question(s) and then search for the lowest price on-line (sometimes while still standing at the Radio Shack store scanning the item(s) with their smart phone app). You could not, for example, purchase a Radio Shack portable computer at Best Buy at a lower price because Radio Shack would not ship them any, even if they asked.

That sam e no-loyalty prospect issue affects virtually all store owners today, some are just large enough to get the manufacturers to either slightly alter a part number or change the UPC sticker to something specific to their store (which at least cuts down on the issue of the prospect using his or her smartphone to scan a UPC code and find Amazon selling it

for less - all with zero customer time investment or local store location/tax issues).

That's precisely why some radio dealers are now getting the manufacturer(s) to modify face plates, alter part numbers, introduce a "new" manual, or slightly modify a product's spec in order to claim their product is unique (and therefore by definition, harder to source elsewhere and worth more money). Frankly, I don't blame them one bit.

I remember a very good dealer source (Kurt from Three Old Crows in Texas) that used to frequent this forum and answer many questions. Time after time I read one user after another make the same remark about supporting a local (or at least a U.S. based dealer) only to read weeks later that same user tell us about finding the product at a different source (almost always based in China or on Amazon) for less money. I even remember Kurt asking once what percentage (above the lowest cost on the planet) a particular end-user was willing to pay to support the local dealer. I believe the answer was something akin to $1 or less. Anything more than that was apparently just too much for that user, I guess. I don't think it was too long after that incident when Kurt decided he was going to have a "going out of business" sale, since his overhead and inventory costs would never justify a $1 difference between his store prices and some hut in China using Amazon's FBA procedures.

Other dealers pre-order product(s), test and configure the product(s), and even travel to various shows to introduce the prospects to the pro duct(s), and are usually met with the same type of response, "but I can purchase this XX product for less on E-Bay, Amazon, or wherever". It probably never even occurs to them that just 30 minutes before that they either didn't know that product existed or didn't know what it could do (until that local dealer took the time to educate them).

Now before you think I'm just picking on someone on this forum while they are trying to get the best "deal", this "not shopping local issue unless it's also the lowest price I can find" affects schools, local and state governments, etc., etc. I can't tell you how many times our local school district asks for more and more funding, yet they have zero issue buying the vast majority of their supplies out of state. The same is true at the local and state government levels. Well, this may be a shock to some, but if the local business community's sales are in the dumps, it will be really har d to see additional taxes pouring into school funding, or state/local budgets (or even hiring or expanding staff levels and reducing the local unemployment rate).

Let me guess:
1) You were surprised to see that the display did not show the correct direction + or - but instead shows both +-
2) You looked to see that the offset was set and found it wasn't

Surprise, surprise, surprise -- that is how the radio is supposed to work -- and it is exactly how the radio worked from the first time you programmed anything into any channel

When you store a memory channel, the radio does NOT STORE any offset or direction. It stores the receive frequency and the transmit frequency.

The display shows +- which is the standard display for a memory channel that is using separate rx/tx frequencies. This same standard is used by Alinco, Icom, Kenwood, Yaesu, and every other ham radio manufacturer that I can think of. The only difference is that most other radios DO store the offset, so they show a + or a - for memory channels that use the standard offset and only show +- for channels which are programmed with an "odd split" (a non-standard offset). But the BaoFeng and most other Chinese HTs are basically commercial designs, not ham designs, so they normally store ALL channels as separate rx and tx frequencies. Offset is provided as a function in VFO mode, not memory channel mode.

Yes. You could just as easily key it in. For a channel with a split
wider than 69.995 MHz or a cross-band channel, you have to key in the
frequency anyway.

>
> It was also puzzling because CHIRP does use those.

CHIRP lets you enter it that way because that is what hams are used
to. But CHIRP immediately does the math and stores it in memory as the
RX frequency and the TX frequency because that is only what the radio
will accept.

CHIRP will also let you key in the TX frequency as well. Just set
Duplex=split and Offset={TX frequency}

It may help to understand the actual internal process. You enter and store the RX freq in a memory channel . Then when you set a shift direction and offset amount, these are used to compute and generate the TX freq side which is then stored in the same memory channel as the TX freq which is stored in the second step. The actual offset amount and direction are not stored in a memory channel.

---In baofeng_uv5r@yahoogroups.com, <mikeearls@...> wrote :

Jim,

Your comment could be confusing, since the other method of programming a memory channel involves setting the shift direction and offset and storing to that channel.

When doing it that way, the TX frequency isn't directly entered.

These radios don't use offsets in MR (channel) mode. They store the RX frequency and the TX frequency.

To change a repeater channel to a simplex channel is possible. You would have to reprogram the TX frequency to be the same as the programmed RX frequency. I don't know of any way of doing that except for one channel at a time.

I think the confusion is that there are two ways to store a repeater in a memory channel. #1, The manual way you said and #2, storing the receive and transmit frequencies separately in the same channel which I do and some others have mentioned. Pick your poison. (Grin)

I, too, jump on Amazon and grabbed a $4 battery.Just a standard one to supplement the one I already
have. It works for me because I'm not a long winder.

From: "Christopher Young cayoung@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com>

Thank you for the head up. Cash flow is really bad,
but I did buy replacement battery. Better now than
later. Hope that's not an issue, but best prepared
  and all.

I have seen me spending about £7 or £8 more to get something from a UK seller, but shamefully, the only reason I will do that is so I can get it quicker. I really should support local Scotland/UK traders. I buy a lot from Amazon and eBay and try to avoid Chinese or Hong Kong traders, purely on the basis that it will take an age for it to arrive. On the subject of stocking up on spare batteries, if Baofeng/Pofung did go under, there will always be some factory in China making batteries for their radios. You only have to look at the PC market, parts for decades old laptops are still being sold online, I wouldn't worry about not being able to get more, but I bought one recently from eBay, and it doesn't charge, so I'd be wary of buying another non-branded one.

Some of the guys on the repeater near me time it out. Not sure
how long that is, but considerable longer than I usually go. Ah,
well, we have our different ways.

I'm also not long winded on the HT.

There is only 1 method for programming a repeater....

1 erase the target memory
2 enter the RX frequency into the VFO
3 store the VFO frequency to the empty memory
4 enter the TX frequency into the VFO
5 store the VFO frequency into the same channel as step 3

The difference is how you get the TX frequency displayed in the VFO at step 4

1 you can enter the TX frequency directly using the keypad (which
doesn't require SFT-D or OFFSET)
or
2 you can set SFT-D and OFFSET to the correct values and then use
"reverse mode" to switch the VFO from the RX frequency to the TX
frequency

That's exactly what I was saying. I never use "reverse" because, to me, that's extra steps. I know this have been gone over before and there were some who felt using the reverse button was the only way to do it. Now lets move on to how many angels can dance on the head of a rubber duck.

This worked. I already had the frequencies programmed in with the offset and the ctcss tone. All I did was program the input frequency and save it to the same channel I previously programmed and it now
automatically transmits on the input.

Thanks for all those helping me out.

Yep. You can go back at any time and update the TX frequency (and also
the TX CTCSS tone or the TX DCS code).

Glad you have it sorted out.

Anyone have a solution for the spur that appears on 442.000? I have a local repeater that I would love to use with this radio that is on 442.000.

Thanks,

Sam

51805. Re: [baofeng_uv5r] Spur on 442.000 on UV-5r

From: Ray Sills
Topic: 51804 Message: 51805

Hi Sam:

If the repeater transmits a PL tone, you could have the rig set up to recognize the PL tone and then open the squelch. Otherwise, the rig should remain quiet on that frequency. I presume that the repeater is strong enough that when you -do- listen to it, that it swamps out the spur, and it’s only when the repeater transmitter drops off air, that you are stuck with the noisy spur.

Unless you're quite comfortable with circuit design Sam, I don't see how you would be able to fix the radio spur. Ray's suggestion would work, but only if the repeater actually pushes the pl tone out on receive (and very few ham repeaters do that).

I think your least costly option would be to upgrade the radio to a different manufacturer. None of my TYT or Wouxun radios have that particular spur.

It's a harmonic of the 26 MHz reference oscillator.
You might also hear it on 156.0, 416.0, 468.0, 494.0 and 520.0 MHz.
It's an "engineering feature" that you can't get rid of.

Date: 2015-07-30 12:58:26 UTC
From: nv7vham@...
Topic: 51804 Message: 51810

I have about 6 or 7 UV-5Rs and have purchased around 20 and set them up for various new and old Hams. These birdies appear in different places depending on the vintage of the radio and
there is no telling where they will end up. If possible try a different UV-5R and see if it goes away. The old UV-5RA I bought over two years ago has no problem on 442.000.

Recently my wife and daughter were helping with the local 4th of July parade and my daughter's
old 2-meter radio decided not to work. I set them up with my wife's UV-5R in advance as a spare
so she just grabbed it. It worked fine but there was a birdie and constant noise that appeared
on 147.34 Mhz which is the local repeater we were using. When they got home I did some experimenting with the radio and found the noise went away if we used one of the long 18" titanium dual band gain antennas. With the A-V85 antenna the noise came back. I did not try one of the rounded tip 4 5/8" dummy load antennas that come with most of the UV-5Rs nowadays
but I am sure it may have not been there.

By using a different antenna we moved the place where reception takes place further away from
the body of the radio where the noise is being made. Of note also is if I took the 18" gain antenna and rolled it up on itself, like we sometimes do to make the radio setup shorter, or placed
the radio on your belt the noise came back.

SWR on an HT antenna means almost nothing since it varies just depending on how you hold the radio. You can't test a ¼ wave antenna in isolation as it needs a counterpoise which is what your body is.

I happened across this interesting project:

Baofeng Antennas <http://dacomp.com/baofeng.html>

<http://dacomp.com/baofeng.html> image

<http://dacomp.com/baofeng.html> Baofeng Antennas

From left to right is a Nagoya NA-805 stubby, a Maldol AS-30 that I had used on another radio, a new Nagoya NA-771, a "no name" generic that I bought off ...

Gigaparts is not a manufacturer either. I'm going to contact Diamond and see what they say.

There are so many fake Diamonds running around I'm very leery when I can't confirm a model#.

I simply figured since Gigaparts and HRO sell them, you would accept their authenticity.

If you look, it is actually a tri-band and Diamond lists it as such.

I'm now trying to figure out the diff between RF Parts Company's Diamond Antenna Division and the Japanese Diamond Antenna Corporation.

Same logo, some same model numbers. But don't appear to be officially related that I can see.

Trying to figure out what antennas are legit and which ones aren't could be a full time job. As to any antenna being "the best", it really depends on how you intend to use it *and* your budget. Not everybody wants to have a 15" long antenna tapping them all day long. For some on this forum, spending $50 for a legitimate Diamond antenna is out of the question, so a V85 might be their "best" HT antenna.

I know what you mean about the legit part….

According to a contact at hamcity.com the US company is owned by Diamond Antenna Corporation (i.e. RF Parts Company which in turn has the U.S. Diamond Antenna Division as part of it).

So we apparently have from the top:

http://www.diamond-ant.co.jp/english/

Who owns: https://www.rfparts.com/

Who owns: http://www.diamondantenna.net

Subject: Re: [baofeng_uv5r] Re: Need UV-5R Antenna recommendation!

Trying to figure out what antennas are legit and which ones aren't could be a full time job. As to any antenna being "the best", it really depends on how you intend to use it and your budget. Not everybody wants to have a 15" long antenna tapping them all day long. For some on this forum, spending $50 for a legitimate Diamond antenna is out of the question, so a V85 might be their "best" HT antenna.

I simply figured since Gigaparts and HRO sell them, you would accept their authenticity.

If you look, it is actually a tri-band and Diamond lists it as such.

I had one of the family members of Diamond Antenna located in Oceanside California come in and state that all the Diamond marked antennas are not legit at one of our trade shows.

So stopped getting them from overseas sellers, I replaced them with Nagoya and other brands mostly MIT versions from Taiwan.

The Nagoya's are green bagged now.

Never ending battle on what is real or not

I know what you mean about the legit part….

According to a contact at hamcity.com the US company is owned by Diamond Antenna Corporation (i.e. RF Parts Company which in turn has the U.S. Diamond Antenna Division as part of it).

So we apparently have from the top:

http://www.diamond-ant.co.jp/english/

Who owns: https://www.rfparts.com/

Who owns: http://www.diamondantenna.net

Topic: 51722 Message: 51832

It has been suggested that most HTs have been designed to operate at almost any SWR as long as it's not a dead short. I have been using one of my HT's into an HF antenna and it works better than anyhting that has a perfect match inside the house...

That would be me...

For some on this forum, spending $50 for a legitimate Diamond antenna is out of the question, so a V85 might be their "best" HT antenna.

Peter,
I'm sure the spammer really appreciates that you gave his spam a second chance in the group. Unfortunately he won't be able to thank you since he became moderated and the original post removed within 20 minutes or so from the original post (many hours before you breathed new life into it by blasting it to the group again).

51835. No Receive

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-31 01:48:16 UTC
From: Stephen Wandling
Topic: 51835 Message: 51835

I've had a UV-5RT for years and it's served me well. A buddy recently did some welding for me and asked that I buy him one as payment. His came as a UV-5RE, and has the same firmware as mine: BFB297.

Today I cloned my programming onto his using CHIRP. The transmit works fine, and the FM broadcast radio works fine, but no receive on the 2M/70cm programmed frequencies.

I had hoped I could search for an answer, but was not successful.

Any assistance will be appreciated.

Did you use the latest CHIRP build? And, did you “read” the UV-5RE before attempting to send your programing file?

No and no. But, now I know I should have. Pressing the MONI button
allows it to receive, so I have a classic situation.

I'm still not sure how I get a current daily build for my Mac. I do
have the the 2014714 daily build for the Mac, for use in the recovery.

I had this same problem. Go to the Miklor website, find the link to the factory default frequency loads, download the...can't remember it's designation off the top of my head due to Dr. Pepper and rum... but you have to get the original software load image and upload that to his radio.

What you did, and what I did, was upload my freq load to his radio and they are different image versions. In the future, download his freq fill with CHIRP, cut and paste from your load to it, then upload his freq fill back to his radio. Clear as mud?

I had the same problem with a friend's UV-5R when I tried to send the one off of my UV 5RE+.

I laughed so hard I spilled some of my Jamesons.

I did the cut and paste and it worked, with the exception of the Name.
So, I copied the Names into the new image and it didn't work. Did it
again and saved it, and it still doesn't show the Name on the radio but
it does show when I Download From Radio. Hmmm?

OK, it's showing the name now, as well as all of the other column
elements. When I press the PTT it shifts the frequency correctly.

But, listening on my other Baofeng, it doesn't open the repeaters, nor
does it receive from the repeaters, even with the MONI button pressed.
Though it does receive a marine weather station.

More Dr Pepper?

More or likely will need the complete recovery done on it.

Then just download from it an original reset template

cut and paste the info to it

reload

It's my understanding that I have completed the recovery. The cut/paste transferred everything except the Name. I put these in individually and they show now.

I am currently testing by transmitting with the old and receiving with the new or vise versa, to no avail. This may be failing because of overload?

I can receive a Marine Weather broadcast.

Why, on earth, would I use such a generator, when I live in British Columbia? Even if it was currently working?

The CHIRP spreadsheet style memory editor has a tabbed interface. As many people suggest, you can load the "image" from the "old" radio into one tab and load the "image" for the "new" radio in a second tab and then copy-and-paste the channel data between the tabs.

It is certainly more convenient to do it this way, but the method that I recommend is using CHIRP's import feature.

What you do is...
1 download from the "new" into CHIRP
2 save the current channels and settings to a file as a backup
3 clear the current channels
3a click on a row
3b press [Ctrl]+[A] (highlights all 128 rows)
3c press [Delete]
4 import the .img file from the old radio
4a click "File"
4b click "Import"
4c click the button that says "CHRP Files (*.chirp)" and select "CHIRP Radio Images (*.img)"
4d locate and load the file from the "old" radio
4e follow the prompts to import the channels from the old "image" to the current tab
5 make any additional adjustments to the channels and settings
6 upload from CHIRP to your "new" radio

This not only works across differing firmware versions, it also works for different radio models and even across different radio brands.

The cut-and-paste did transfer the "name'. There is no way for it not to do this. It is just that the Memory Display Format of the target radio was not set to display the names.

In CHIRP you must go to the Settings -> Basic Settings menu panel and set "Display Mode (A):" and/or "Display Mode (B):" to "Name".

Thanks Matt. Just what I needed! So much easier than looking everything up in the callbook.

Seems to be working, unless the "fault" is something obscure that I haven't seen. Mind you, I've only read the list, not fed it into Chirp, so maybe that's where it falls over. Still very useful nonetheless.

Jim,

I was surprised when it didn't also transfer the name. But, it didn't. While the name was in the image I uploaded into the new radio, it didn't show on the radio, and I checked that setting was to show name. When I downloaded the image from the new phone, the name column was blank. I put them in by typing them in and that worked.

So, it appears that I have got this rig set up. It scans, transmit/receive works.

Thanks for the help.

Stephen,
I am happy to hear that you have it sorted out. Be sure to upgrade to
the latest CHIRP daily build (if you haven't already). It will prevent
you from accidentally uploading the image in CHIRP to the wrong radio.

Jim,

Yes, I got the latest daily build for my Mac, and it wouldn't let me upload the image from my old radio to this new radio, because of the firmware differences. I often need adult supervision these days. ;-)

Thanks again.

From: stanwhite_snr@...
Topic: 51869 Message: 51869

Two years I have been playing with various UV-5Rs, and just discovered something new...

You can select the CTCSS, and enter the numbers, rather than select the tone using the up/down keys.

And I just tried one radio with 214Hz TX, with the other on 214Hz RX. It worked. And setting the TX to either 210 or 218 did not open the RX set on 214....

One radio has BFS311, the other N5R2407.

So (why you would want to, I don't know...) You can set "non-standard CTCSS tones. There is a caveat. The setting does not survive a switch off/on... It reverts to whatever "proper" CTCSS tone was originally set, so it looks like this does not get stored in flash ram...

Oh the fun of these little radios continues unabated :-)

That’s good because certain mismatched upload errors would over write the rx functions. So you can pickup the Marine VHF, means that rx portion is working.

Check all the channels to insure nothing is out of order in the memories section in Chirp

Do not feel bad, this happened to me Twice and at least a dozen customers with older versions of Chirp and matching new/old firmware versions have done the same thing.

I think part of the issue is the naming of the Chirp files. 99% of folks unfamiliar with Chirp (like many of the first time downloaders) would think the "stable" release would be the version to download and that the "daily build" is more of a beta release (not as stable) - instead it's basically the reverse.

In addition, many folks are so frustrated with getting their cheap illegal programming cable to work (with any release of Chirp) that when they finally do they leave everything "as is" (sometimes for years). Guess what happens when they purchase a new radio and try to program it with a really out of date Chirp version? They get the same problem Stephen had, over and over again.

Of course Baofeng didn't make it any easier (with showing the same fake version with the powerup [3] key issue), which again causes many new to the trials and tribulations of Baofeng programming to incorrectly assume the two different radios are using the same firmware (even when they are not).

Stan,

This the way it has always been. You can program any frequency from 67.0 Hz to 254.1 Hz in 0.1 Hz increments using the keypad or the OEM software. CHIRP only supports the 50 standard CTCSS tones.

The reason it doesn't stick is because you never changed anything. In MR (channel) mode, you cannot make any changes to a channel's programmed parameters. Even though the menus let you go through the motions of changing a setting, the menus are "read only" in this mode and can only be used to see what the current setting of each menu is.

You must go to VFO mode, key the TX frequency into the VFO, set menu 13 (T-CTCS) to the desired frequency and then use menu 27 (MEM-CH) to update the CTCSS tone frequency for the target memory channel. After that, the CTCSS frequency will be updated and just a permanent as the rest of the memory channel's parameters.

Aha, so your strategy for stopping spam is to spread the spam over and over just in case someone missed it the first time.

You don't have the brain to learn how to read email headers and you aren't willing to take the effort to look up the IP address where the spam originated then look up the owner of that IP address so you can complain to their service provider, nor to verify the owner of the website being advertised in the spam so you can complain to the owner _and_ to the service hosting the website.

But you can cry and moan.

This email has been checked for viruses by Avast antivirus software.

1. Import the CSV into CHIRP
2. Upload from CHIRP to the radio
3. Download from the radio to OEM software
4. Save from OEM software as a .dat file

For Windows users, this is easy. To convert a CSV (Comma Separated Values) file to DAT, assign a new file name with the DAT extension using Notepad.

There are several internet software programs that can be downloaded to accomplish this (Google your request for more info if needed), but Notepad provides a free option that accomplishes the same result.
Step 1

Launch Windows Explorer. Browse to the CSV file you want to convert.
Step 2

Right-click on the CSV file and select "*Open With*," then "*Notepad*."
This opens your CSV file in Notepad.
Step 3

Click "*File*," then "*Save As*." Type the DAT file name. For example, if the name of the CSV file is "db.csv," you can type "db.dat."
Step 4

Click "*Save*" and your CSV file is converted to a DAT file.

51881. QT/DQT Dec tone in Chirp

Yahoo group: baofeng_uv5r (2015)
Date: 2015-07-31 19:53:20 UTC
From: brian@...
Topic: 51881 Message: 51881

I am trying to program my BF-8HP to use both the Dec and Enc codes. They are different codes. The Dec ins 103.5 and the Enc is 100.0 through the software I can get a code in but the code is the same for both the ENC and DEC. How can I get then to be different numbers?

Thanks.

51886. Re: [baofeng_uv5r] No Receive

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-01 06:55:23 UTC
From: R Pryor MAEd CETsr
Topic: 51835 Message: 51886

When I suggest to people around here to buy RTS or buy a better programming cable that works with updated drivers, I get looks of horror because it cost more than $20

Had a customer call and leave repeated messages for the last few days about resetting his radio again.

This is the 4th time too. Last time I disabled the reset menu so they had to do this in freq mode.

The previous time they did this (they because he claims he didn’t do it, the dog or something did) I had him send me the radio body and uploaded the program and resent it back (on my dime)

This time it is $25 I will charge to fix an operator error issue. No more free shipping as the $25 will cover this too. This will also get rid of those that bought the radios off Amazon and claim they bought from us to get a free programming too.

I am not sure if they are trying to upload or clone radios with mixed firmware and doing this and then in a panic doing a reset to it. NO idea.

I realize this guy might have mental issues as this is what I have been told, however screaming on the phone with voice mail messages does not help getting support.

I am going to direct this person to Baofeng Tech for his next purchase.

BTW: He called 3X a day the first week he had his radio with idiot issues from the A/B switching to name display settings he kept messing with.

A few times he had the squelch set to 9.

Do you get complete dipsticks like this Craig? I dread talking to these type of people when they come off medication and cannot remember what they did to their radios. I think these people are better served with an on/off and a knob channel selection radio without any buttons on it.

From: mailto:baofeng_uv5r@yahoogroups.com
Sent: Friday, July 31, 2015 10:45 AM
To: mailto:baofeng_uv5r@yahoogroups.com
Subject: Re: [baofeng_uv5r] No Receive

I think part of the issue is the naming of the Chirp files. 99% of folks unfamiliar with Chirp (like many of the first time downloaders) would think the "stable" release would be the version to download and that the "daily build" is more of a beta release (not as stable) - instead it's basically the reverse.

In addition, many folks are so frustrated with getting their cheap illegal programming cable to work (with any release of Chirp) that when they finally do they leave everything "as is" (sometimes for years). Guess what happens when they purchase a new radio and try to

program it with a really out of date Chirp version? They get the same problem Stephen had, over and over again.

Of course Baofeng didn't make it any easier (with showing the same fake version with the powerup [3] key issue), which again causes many new to the trials and tribulations of Baofeng programming to incorrectly assume the two different radios are using the same firmware (even when they are not).

On Fri, Jul 31, 2015 at 10:30 AM, 'R Pryor MAEd CETsr' doopsnoop@... [baofeng_uv5r] <baofeng_uv5r@yahoogroups.com> wrote:

That’s good because certain mismatched upload errors would over write the rx functions. So you can pickup the Marine VHF, means that rx portion is working.

Check all the channels to insure nothing is out of order in the memories section in Chirp

Do not feel bad, this happened to me Twice and at least a dozen customers with older versions of Chirp and matching new/old firmware versions have done the same thing.

Subject: Re: [baofeng_uv5r] No Receive

It's my understanding that I have completed the recovery. The cut/paste transferred everything except the Name. I put these in individually and they show now.

I am currently testing by transmitting with the old and receiving with the new or vise versa, to no avail. This may be failing because of overload?

I can receive a Marine Weather broadcast.

I have that with my MBP, simply turning the radio off and on again normally clears it.

Make sure the cable is firmly seated and that the radio is in a channel that is squelched (no activity)

it is essential that you always use the same USB port, installing the driver once installs it only for a single port, plug into a different port and you will need to install the driver again

good luck, it can be frustrating!

Like I said above... you shouldn't be using the over 1 year old CHIRP
v0.4.1 stable build. You must upgrade to the latest daily build. If
that doesn't fix it, then you will look into the driver.

From: wb8yqj@...
Topic: 51894 Message: 51894

Baofeng from 2 weeks ago has firmware N5R-20, the one that came today has N5R-2407. Both are BFB297. Newer radio has working signal strength meter, copper color wriststrap post and the molded buttons for CALL and MON text is smaller. Has me wondering how many different places in China are making this same radio. Both radios working FB.

Radios with N5R-20 firmware started shipping 1 year ago this month.
N5R2407 is the currently shipping firmware. Your "2 week old" radio
was probably made a year ago and that is most likely why the 2 radios
are so different.

I use a Mac computer and the latest daily build of CHRIP. I have received an error message when trying to download or upload files between radio and computer. But 95% of the time if I repeat the process it will work the second attempt.

Like I said above... you shouldn't be using the over 1 year old CHIRP
v0.4.1 stable build. You must upgrade to the latest daily build. If
that doesn't fix it, then you will look into the driver.

Hi Jim,

I found it didn't stick in VFO mode. As in, I selected a frequency to operate on, selected an odd CTCSS, and it all worked. But turning the radio off and back on, it reverted to the original setting I had set for CTCSS.

Hmmm. While in VFO a of my UV-82HP, I just entered an "odd" CTCSS tone (67.1 Hz) into menu 13, powered it off and back on and the same tone was still there. What radio and firmware version are you trying this on (don't say BFB297 unless the radio is 2 year old ;-)

51899. Fm radio issue uv5r

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-03 08:26:49 UTC
From: molbison@...
Topic: 51899 Message: 51899

Hi guys, I have a few uv5r,, one quite a few years old and the second more modern with the silver grill on the front speaker. Here is my issue,, I sometimes like to use the FM radio feature on the HT for instance when I'm relaxing in the bath or out on walks etc,, however I can't figure out how to listen to the FM radio exclusively,, what I mean is every time I listen to the FM radio, it is constantly interrupted when any of the frequencies in the VFO become active. Example, my VFO may be set to the UK PMR frequency 446.00625, I press the orange button on the side to listen to the radio but every time somebody speaks on the PMR channel the radio immediately switches back to the PMR channel and interrupts my enjoyment of the FM radio. How can I listen to the FM radio exclusively without the active VFO frequency interrupting it ?

regards
Marc

I would program in 2 channels that are for nothing and set those to A and B. If you chose inactive channels then there will be no traffic to interrupt your bliss.

Samuel is on the right track. You only need to program 1 channel. Select a frequency that isn't likely to have any traffic on it. And just in case their is a signal, choose an program a receive CTCSS tone or received DCS code. If you are using a programming cable and software, be sure to program it so you can't transmit on it.

Then switch to MR mode and select this "special" channel in the selected display (A or B or even A and B) before switching to FM mode.

Hi Jim,

Really odd... I cannot reproduce what I was doing last week, which was on a BFS311 and an N5R2407. Whatever key sequence I had used in VFO mode, it didn't save.

I just tried again, and as long as I pressed the menu key, and got an audio "confirm", it saved it, even if at that point I switched off and back on.

I am wondering if the years are finally deciding to be unkind to me..... :-)

Now what did I do... I am going to play some more...

51908. UV-5RA "stuck" in low xmit power mode

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-03 20:41:54 UTC
From: kb4oam@...
Topic: 51908 Message: 51908

The radio was working great yesterday...today, at turn-on, there is no difference in RF output power between HI and LO modes, either selected thru the menu, or toggled using the "#" key.
Same on both 2-meter and 70-cm modes.
Measured output on the spectrum analyzer is 29.7-dBm (0.9-watts).
Factory reset via the keypad made no difference...."hard" reset (MON switch depressed at turn-on) also made no difference.
Any ideas?

73 de Jerry, KB4OAM

51909. more: UV-5RA "stuck" in low xmit power mode

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-03 20:48:11 UTC
From: kb4oam@...
Topic: 51908 Message: 51909

Forgot to mention, the display DOES toggle, i.e., "L" in LO-power mode, nothing in HI-power mode...the bar-graph during transmit is 3-bars in LOW mode, full-bars in HI mode.
When attempting to change thru the menu, the power mode appears to toggle correctly.
Just exactly the same 29.7-output in both modes.

Jerry

It is my understanding that the workflow is supposed to be:

1) download from radio, to Chirp
2) make changes to downloaded configuration (e.g. manual edits, import .csv, etc.)
3) upload from Chirp, to radio

I *think* this is the scenario that you said works, but that you're having troubles creating a new tab, importing a .csv, and trying to ship it to your radio.

I'm a newbie to Chirp, but my recollection is that the only place you tell Chirp what kind of radio you have is when you a download from the radio (i.e. step 1 in my workflow). If you start with a new tab, Chirp doesn't know what kind of radio you have, so it doesn't offer you the option to upload it.

Depending on the acid levels within your fingertips, you may just have to accept that your keypad buttons will wear out faster than other users.

Yes, you could keep putting on clear fingernail polish, or keep replacing the keypads, or use a keypad cover.

Of course another option would be to upgrade the radio to some other brand that doesn't seem to have so many users complaining about wearing out keypad buttons. TYT or Wouxun's anyone?

I'm not sure if my problem is related to this (low/ no transmit) output? I bought a UV5R from 409 Shop.com. It had no (0) transmission output. Tested on a Diamond tester, into a dummy load.
I paid return postage to send it back for replacement. When I received the replacement radio, I tested it. It has the same problem- 0 transmit power (on low or high).

Has anyone else had this experience?

I have my radio inside my pant's side-pocket; I have it this way, to keep me from denting/scratching the case. The buttons face IN.

My buttons wear off as described. (The lower-right and the lower left.)
I RARELY use the buttons at all; Once a month, I select A/B to toggle a frequency.
I have changed the popple pad, which offers no longer service than the original.
I have experienced this on many UV series; It is the same for my UV-B6, the latest.

I have used clear nail polish, which is imperfect, as it is viscus; Is there a thinner clear nail polish or similar?

After fiddling around with the keypad I can see that only the lightest dusting of color covers the rubbery membrane, it is not long for any practical wear. I tried the clear nail polish but it does not want to remain on the flexible surface.

The issue is global, one solution would be to have keypad replacements for like 99 cents and change them every couple months.

The better solution would be for a company to create a better UV-5R keypad and make a fortune with the number of UV-5Rs out there.

The extreme low cost of the UV's has to show up somewhere...

"The extreme low cost of the UV's has to show up somewhere... "

Honestly, we could start a list. I would add the extremely wide front end of the radio, the poor antenna 99% of them ship with (which helps to hide the poor receiver), and poor overall quality control. But in context, these issues (and many more like it) are what you live with at the price point of these radios.

I would get the rubber sleeves the rubber has just enough thickness to contact a pouch or pocket to be the friction point when removing and inserting the radios in a pouch. The keypad is still exposed for easy use but the raised rubber shroud gets the wear and tear instead.

Subject: Re: [baofeng_uv5r] Re: Keypad wear - think I have a solution.

I have my radio inside my pant's side-pocket; I have it this way, to keep me from denting/scratching the case. The buttons face IN.

My buttons wear off as described. (The lower-right and the lower left.)
I RARELY use the buttons at all; Once a month, I select A/B to toggle a frequency.
I have changed the popple pad, which offers no longer service than the original.
I have experienced this on many UV series; It is the same for my UV-B6, the latest.

I have used clear nail polish, which is imperfect, as it is viscus; Is there a thinner clear nail polish or similar?

73; -Mike- K0JTA

409 shop has replacement pads.

Those that have this problem need to get the rubber sleeves. They come in different colors and can give the radio a new look just by changing sleeves. If wet the rubber is easily gripped too.

If the radios are dropped the rubber acts as a cushion and protects it from breaking. I do know that no dealers will replace the worn out pads under the 1-year warranty as this is not covered by the manu.

Subject: Re: [baofeng_uv5r] Re: Keypad wear - think I have a solution.

After fiddling around with the keypad I can see that only the lightest dusting of color covers the rubbery membrane, it is not long for any practical wear. I tried the clear nail polish but it does not want to remain on the flexible surface.

The issue is global, one solution would be to have keypad replacements for like 99 cents and change them every couple months.

The better solution would be for a company to create a better UV-5R keypad and make a fortune with the number of UV-5Rs out there.

The extreme low cost of the UV's has to show up somewhere...

I never bought in to the pricepoint idea until $50 units became $25 units. I guess everyone has a magic number. Also I had to see one, a friend picked one up and I thought it was fun and flashy. I had no intent to use the device as a hard service radio, but a radio to take on the dog walk.

I am glad it's not the only radio I can afford.

But one thing that the big three (plus one) never offered was inexpensive accessories, you paid for one PC cable, speaker mic, or charger at the same price that you would get an entire UV5 with -all- accessories. A speaker-mic is $4.60 -delivered- (bought one yesterday) and a battery for $4.00 delivered. Some of these (like the Baofeng PC cable) work with the big three devices.

Yes I have been fiddling with the keypad a bit and that speaker mic will need to be rebuilt to make it sound better but it's cheap fun.

Craig to let everyone know, I was informed some of the recent releases have quality control problems with a high 20% out of box failure rate. They did not specify the exact failure, they only specified Baofeng’s problems with quality and poor customer support.

All of this coming from Chinese companies too.

Hopefully, the bad batches will not make it over here.

Honestly, we could start a list. I would add the extremely wide front end of the radio, the poor antenna 99% of them ship with (which helps to hide the poor receiver), and poor overall quality control. But in context, these issues (and many more like it) are what you live with at the price point of these radios.

It's not just our cheap Baofengs. Name brands have their problems as well.

I've got a Yaesu VX-2R with the same problem. Replaced the keypad on that once. A Panasonic cordless phone and a Panasonic TV remote have all worn off in the past for me.

Yes some of these are being dumped at historical low prices. We been told shortages are coming due to closures and cutbacks on part supplier assembly lines. Most likely once the discounts go away and shortages show up, the prices will increase. If some suppliers of the components go out of business it might be awhile to find a replacement company causing further replacement/supply problems.

China has been hit hard and some panic and closures/reshuffling going on.

The most interesting part of the info I got is that many of the other competitors- (We are Talking Chinese companies here) want Baofeng to go under due to their low price benchmark for the whole radio industry and biz model of low cost , high production/volume sales.

I found that was interesting to know how they viewed Baofeng which is very different from how we view them.

I received a UV-5R from Amazon Saturday with great condition and firmware level, it only took 6-7 days to get to me. I quickly placed "Buy Again" the next day, but they raised the price 20%

Even though I chose "Buy Again", seller name had changed, hard to imagine seller had sold out their entire inventory in 2 days.

Item sat for days "preparing for shipment" so I cancelled, which can be tough if the order is far along in process, but immediately got the cancel confirm.

-Seems like- prices are already going up, supplies becoming limited...

"Hopefully, the bad batches will not make it over here."

Rich,

For you and me on factory direct orders, I doubt we'll see a huge jump in DOA units (above the normal rate), but for the folks that purchase 1 or 2 at a time through Amazon or E-Bay it would not surprise me one bit to read more and more folks having issues. One forum user reported getting a Baofeng radio with no power out, paying to return it to the Chinese web-hut, and then getting the replacement radio with no power out as well.

What I have noticed is that Baofeng is getting slower and slower in shipping out dealer orders (which could indicate some supplier issues as you have suggested). Placed an order two weeks ago with Baofeng, and a day later with TYT and Wouxun. Both the TYT and Wouxun units are already here (in time for this weekend's hamfest in NM), but the Baofeng order has only today been given to DHL, so we won't see those new TP units until next week.

"If" we don't sell-out on the Moto-Trbo DM-380 units, I'd like to program one with the AZ codeplug just to play around with DMR. If we do, maybe I'll "claim" one of the 220 MHz TH-9000 mobiles and finally get some power on that band.

It is nice to be reminded of the value of a brand. If you save some money, you may surprise yourself or you may need to "Go Fish" with your order. You want the price, you want the features, you want it work, and you want to get it fast. I also like the latest firmware. If you can get all that you are doing very well indeed.

It's an old sales statement, but still true today. Speed, quality, or cost - pick any two you want. In Baofeng's case, they are trying to determine if they lower the cost far enough, just how much of the other quality consumer's are willing to give up. In today's high tech world, I'd be inclined to add a 4th option (performance), and still tell folks to pick any two they want.

Honestly, my problem right now is getting the extra time to play with all the new radios. The 10w TYT dual-band handhelds are quite popular right now, but so are the MD-380's - as you well know. I do wish that TYT had managed to include VHF on the MD-380's however. It's the one thing I think they missed on that radio, still for under $200 for a new MotoTrbo with 1000 memories and a color display, it's hard to argue. It will be interesting to watch the reaction within the ham/prepper/outdoor community when the new mobile dual-band is launched officially next week.

Yes. That's what happened, although I'm not quite sure why that should warrant an alarm.

Actually it IS showing the proper symbol -- the industry standard symbol for a memory channel saved with an "odd split" or separate Rx/Tx frequencies -- which is exactly how these radios save ALL memory channels (other than simplex if you leave the simplex channel only half completed).

This behavior is fully addressed in the user manual and in the FAQ and is repeated here at least once a week in response to each time someone asks exactly the same question.

Subject: [baofeng_uv5r] Offset Display Icon in Channel Mode

When I manually program a 2 meter repeater into Frequency Mode, everything looks right and I can get into the repeater OK. When I save it to Channel Memory, I notice that the display shows both + and - , not just the proper - symbol. Still, I can key the repeater from Channel Mode. It just looks odd, especially since in Frequency Mode the display shows the proper - symbol. Anyone have an explanation for this??

This is normal. Shifts and offsets are a "ham radio" thing. The UV-5R and its many variants are a commercial radio used by hams because they cover the ham frequencies "out-of-the-box" and because of their low cost.

Menu 25 (SFT-D) and menu 26 (OFFSET) only function or have meaning in VFO (frequency) mode. These radios do not use shift direction or offset to store memory channel information. Instead, a memory channel only contains the RX frequency and the TX frequency. The "+-" indication in the upper status display is to let you know that the TX frequency is not the same as the RX frequency. Which would be in the case of a repeater, odd-split, cross-band or TX inhibited channel.

Jim,

I found the so-called "hard" reset info browsing different Baofeng
user messages.
I will try downloading and restoring the factory image this weekend
to see if that rectifies the problem.
Thanks for the advice.

I've got one UV-5R programmed and working fine on the 3 repeaters that are nearest me. Initially I couldn't hit when I was literally sitting under the repeater on the TV tower. That radio hits fine now that it's programmed, and I've had a couple of simplex hits ON freq, with guys closer than the repeater.

The working radio shows both the + and -.

That other %^$#@! radio, works great in Freq Mode and will hit the same repeaters. But it will NOT carry the settings over to Channel Mode.

I've used the Tips and Flow Charts out there on the interwebs over and over. I'm resetting the radio to Factory Spec, Chinese Prompt Lady Level before trying to reprogram. So the slate is clean, but it won't work for me.

I have a cable ordered and I'm hoping I can clone the working radio to the %^$#@! other one. But I'd gladly do the manual and hold the cable for storing a clone in case I have a failure later.

thanks in advance for any help offered,

Schteveo in NC

51955. UV-5R Batteries

Yahoo group: baofeng_uv5r (2015)

On July 28th I ordered two new regular batteries for my UV-5R radios for $4 each (with free shipping included) on Amazon -- today they arrived.
Once I managed to cut through all the tape on the box I was amazed to discover that I was looking at the top of an obviously broken RADIO (dirty, no knobs, etc). Once I dumped the package out on the table I found my two new batteries, still in sealed plastic wrappers, had been packed inside at front shell of an old junk HT.
Since they also used some bubble wrap to fill up the box, I assume that they weren't using the radio shell to take up space but as a way to get around the international regulations against air mail of lithium batteries because those regulations include an exemption for batteries that are part of an electronic device. Apparently the front shell of an old discarded HT was enough to make these two new batteries "part of an electronic device"

Could be.

On 7/26, I ordered two of the 1800s and one 3800.

The two 1800s shipped 7/28, China Post with a LN…..CN tracking number, arrived today in a padded manila envelope.

No disguise, just bubble wrap.

The 3800, which shipped 7/27, apparently hasn't made it to the US yet has a normal USPS tracking number.

Actually the Post Office creates its own abuse. Both Fed Ex Ground and UPS agree the most costly part of a residential delivery is the last mile from the local depot to the house. Each delivery is a one time deal meaning the Fed Ex or UPS driver has to drive a truck all over looking for addresses. Along comes the US postal service and tells Fed Ex and UPS that since the post office goes to every residential address every day, the postal letter carriers can deliver the packages for them. So, Fed Ex created Sure Post and UPS created Smart Post. Each one picks up from the shipping company,hauls the packages to the local post office, and the post office then delivers the package to the residential addresses on the letter carrier route. Of course the post office gives Fed Ex and UPS a huge discount for doing so. OOPS! Those packages are too many and too heavy for the letter carrier to deliver, so the post office loads them into trucks and delvers them that very expensive last mile. Good for shippers, buyers, Fed Ex and UPS. Bad for the post office as they now have to spend money on trucks running all over looking for addresses. Oh and ever buy from Amazon and have the post office deliver on Sunday? How much did the post office lose on that?

Jerry,

I don't know. If you are looking on the schematic that has been available since 2012, it has been known to have many mistakes. It has nothing on it that makes me believe that it was actually made by Baofeng. And the UV-5R radio family has gone though several generations since 2012. You might be able to tell by opening one up. I have never opened one up. Sorry.

It sounds like you are skipping the step to save the TX frequency to the channel or you are not getting the correct TX frequency into the VFO before you do the 2nd write to update the TX frequency.

It is a real simple process
1 - you key the RX frequency into the VFO
2 - you write the VFO frequency into an empty memory channel
3 - you key the TX frequency into the VFO
4 - you write the VFO frequency into the same memory as step 2

Obviously you need to have the other settings like T-CTCS, TXP, WN, etc correctly set too.

I sounds like you need to set your display to a slightly higher vertical resolution.

The button on the left is [Default]. It sets all of the settings in that menu to the software defaults (which are different from the radio's defaults as delivered from the factory and the radio's firmware defaults (the settings the radio has after a RESET)).

The button on the left is [Close]. It closes the Optional Features menu.

That is an interesting story - and I don't doubt that it could well be true - I do find it interesting that the Postal Service used to highlight their story about a company that shipped building materials, including cement blocks, to a remote town in Alaska because it was cheaper than having them trucked there even though the cement blocks had to be mailed individually and cost several thousand dollars total to mail.

The really interesting part of the building materials to Alaska story that the Postal Service never mentioned, was that hauling those building materials to the middle of nowhere in Alaska didn't actually cost the Postal Service anything because the building materials were all shipped Fourth Class Mail which gets loaded only after the other classes of mail, so they were actually carried over several weeks on the same mail truck that would have made the daily trip anyway.

You got the names reversed -- FedEx has "SmartPost" -- which ought to be named DumbPost from my experiences with it.

I don't mind vendors using UPS SurePost, but if I know a vendor uses FedEx misnamed SmartPost I will insist that they ship my package by another method or I will shop elsewhere.

The reason is strictly one of personal convenience.

I live close to the UPS hub, so anything that travels by UPS gets here about a day sooner than any other carrier. UPS SurePost doesn't mail from Louisville, locally they mail from Hebron KY, but it still gets here about a day faster than straight USPS mail.

On the other hand, to get a "SmartPost" package to Louisville KY, FedEx mails it from Indianapolis IN -- and to get the package to Indianapolis, at least half the time they truck it THROUGH Louisville to reach Indianapolis. One recent package was trucked through Louisville TWICE while FedEx was trying to get it to me from Ohio. The trucked down I-75, through Louisville farther down I-65 to a FedEx facility about a hundred miles SOUTH of Louisville, it sat there for almost 24 hours, then they trucked it back up I-65 through Louisville to Indianapolis (about 100 miles NORTH of here), where it sat overnight before being passed to the post office who had to truck it back down I-65 to Louisville, to a sorting center before it got to my post office for delivery. It took a full week by FedEx DumbPost when it would have taken 3 or 4 days by regular mail depending on what time the vendor gave it to the post office in Ohio.

Hi.

IIRC, it was stated that both V&U outputs are at the same level. If so, I'd sooner look at what's controlling the level.
On the schematic, it would be the circuitry to the right of the output amplifier string, U3 etc. might be a good place to look.
See if any levels change with the selection of hi/lo, perhaps at Vr2's leads.
If the level from the MCU changes, it will be in the control circuitry, if not, the micro's got a problem.

Good Hunting!

Stan

I think my favorite is Parcel Post (that's a totally mismanaged train wreck), and the all time favorite is DHL Global Mail.

USPS will deliver from anywhere in the US to Hawaii in 3 days. 3 DAYS for the best price when shipping priority mail. NOW with that in mind, USPS only does 2 day air for about 2-3 times the cost of USPS, and FED EX only does the air also for the same cost as USPS. The really interesting thing is that FED EX is the ones who CARRIES THE USPS MAIL TO HAWAII!!! So basically, if you wait one more day, you save a TON of money. Parcel post takes a week minimum, and will usually be anywhere from 10-14 days.

On October 18th I ordered some t-shirts for the family as a "gag" christmas present, expecting them to arrive about 2 weeks later, which would give me plenty of time in case the sizes were wrong. Guess what. They were shipped DHL Global mail, and the t-shirts arrived DECEMBER 28TH!!!! Yep... that is correct a whole month and 10 days after ordering.

Since that time, I've had a total of 6 shipments sent by DHL Global mail, and the quickest shipment took 18 days. I have seen packages sit for up to 8 days in Hebron KY with DHL Global mail before being transferred to USPS for final shipping.

NOW a little known fact. The USPS priority mail 3 days has the same cost to ship from across town to across the Pacific.

Yeah... and when I have received parts through China Post or Hong Kong or Singapore post, they get to me (after stopping in California) about 14-16 days from shipping, but it's been almost 30 days, and I'm still waiting on the last two packages I will ever order shipped by DHL Global mail.

Sorry for the rant, but it's my latest mission in life to put DHL Global mail out of business... because they are AWFUL!!!

Topic: 51908 Message: 51970

I just got my UV-5RA today (microcode version 5NR2407/BFB297) and it seems flakey with respect to Tx power.

My local repeater told me the signal strength was S2, regardless of the power setting. I set the power setting with the menu, checked the menu to confirm that the desired power setting was in force, and ran the test. The reply was always "S2" on low and on high.

When I hit the same repeater with my FT-60 It gave me S3 on low, S3 on mid, and S5 on high power.

Then I read that it was possible to toggle the power setting with the "#" key. After screwing around with that for a while, the Baofeng suddenly perked up (relatively speaking): S3 on low, and S4 on high.

This doesn't inspire confidence. Should I not expect more, when I only paid $28.00? Still, if it behaves erratically over the next few days, I think I'm going to ship it back to Amazon.

I just experienced the exact same scenario. I had figured it was to make the product destruction proof, but your explanation has a more "corporate" feel to it. The packaging had none of the required lithium labeling on it. It was way to small for it anyway.

---In baofeng_uv5r@yahoogroups.com, <xaunloc@...> wrote :

On July 28th I ordered two new regular batteries for my UV-5R radios for $4 each (with free shipping included) on Amazon -- today they arrived.

Once I managed to cut through all the tape on the box I was amazed to discover that I was looking at the top of an obviously broken RADIO (dirty, no knobs, etc). Once I dumped the package out on the table I found my two new batteries, still in sealed plastic wrappers, had been packed inside at front shell of an old junk HT.

Since they also used some bubble wrap to fill up the box, I assume that they weren't using the radio shell to take up space but as a way to get around the international regulations against air mail of lithium batteries because those regulations include an exemption for batteries that are part of an electronic device. Apparently the front shell of an old discarded HT was enough to make these two new batteries "part of an electronic device"

I ordered some 18650 (lithium) batteries from china, they were marked
Ni-Cad(on the contents list.) so they could ship them

Is this the start of the defective rate of 20% that was reported by some Chinese companies?

The dumper radios were supposed to be really discounted, the $28 dollar version qualifies for this.

Most likely you are not going to compare your Yaesu FT 60 or any Icom, Kenwood, Motorola, made radio to these. These are bare-bone cheap workhorses that are full of oddball glitches and wonderful amazements.

Just to let you guys know.

For me to order Li-on batteries the shipper and I need to do these things.:

1. Have them shipped by special carrier
2. Have a stack of certified MSDS Hazmat documentation included in the shipment
3. Pay a Hazmat fee
4. Pay an import Customs fee
5. Have a weight limit I cannot exceed
6. Have all wrapped in Cellophane sealed wrappers
7. Have those sealed wrappers sealed in a box
8. Have those boxes placed in stack boxes- so no movement during shipping.
9. Including Peoples Republik of Kalifornia warnings and labels that the batteries might contain something that could possibly cause cancer or harm the environment

It is cheaper for me to order 1 battery at a time with free shipping than to order 20+ extended batteries using the way above.

The problem using Amazon is some batteries they shipped were USED or DOA. You could see the contacts worn on the back showing they were used.

The above hassle method allowed direct from the factory versions and since Amazon tends to have used stuff marked as new or stock supplied from sellers selling used items. I stick with the factory versions only.

I posted this earlier, but will do it again since this is a support group for these radios.

Chinese companies have advised me:

1. They are seeing up to a batch 20% failure rate level/return rate for the Baofeng radios since July.
2. Some of the part suppliers are laying off or closing down/idling assembly lines causing shortages
3. New radio models have been delayed due to reasons above and other issues – New examples : Some digitals and new models that just came out
4. They complained about Baofeng's biz model and poor cust service- and this is TO THEM (Chinese) I can only guess what it would be for us Laowei

Part of the problem (Their explanation) was the high volume, low cost sales. Drop prices so low that you drive the competitors out, the problem was they make very little profit doing this so must rely on huge volumes. Any disruption like a slowing economy, inflation, wage issues, shipping cost has hurt some of the profits. The big kicker is losing millions in the stock market.

So they are trying to put together and rush out radios with what parts they have to clear inventory- cut back costs further (testing QA/QC) buying lower quality parts, and overworking the production people.

This is why a some bad ones are circulating again, TX power was a mentioned issue but not 1 watt specifically but versions that had 3 watts or so output. I guess 1 watt output can be added to that list too.

The jack issues again with bad jacks- now on the speaker side too. Stuck PTT's and ones with audio problems (unknown reason)

Hopefully, these would be worked out and Baofeng will be up and running 100% again and make it successfully through this storm.

Most likely you will need to return it, some customers of mine have complained they have gotten 3 bad radios , exchanging all three, until they got a good one.

I do NOT know if these problems are related only to specific versions? HP's TP, regular uv5 , Uv82's Uv82 TP not sure they did not specify but mentioned it is across all models.

I do know I am going to be careful buying a large quantity , just in case.

Some of the NEW UV82 Tri-powers are starting to show up, hopefully those are problem free. The Uv82 seems to be the less problematic version out of them all.

This doesn't inspire confidence. Should I not expect more, when I only paid $28.00? Still, if it behaves erratically over the next few days, I think I'm going to ship it back to Amazon.

The problem is one of cost for the shipper. "If" DHL (or Fed-Ex, or UPS, or even the USPS) offers large shippers a price below what everyone else is charging them for that size/weigh package, then guess what? Unless you (as the buyer) is willing to pay more for the shipment (and since soooooo many want free shipping, even on a sub $5.00 item), your shipper will ship to that new lower cost standard.

I understand that for most of us, we'd be willing to spend a $1 more to get a package 1 to 2 days sooner, but when you are shipping thousands of packages a day (like Amazon for example), saving the .25 cents per package adds up.

Yesterday it appeared that my uv-5ra was stuck on low power. Today it appears to be stuck on high. Now, no matter what the power setting, the repeater reports S8. Previously, no matter what I did the repeater reported S2.

In addition, one of the memory locations I had previously programmed, spontaneously changed itself from FM to Narrow FM. I had to rewrite the uv-5ra twice using Chirp, before the change took effect.

Yes, this is one flakey device.

Can't speak for the programming issues, but for the power issues, the ONLY way to check is with a known good power meter, into a known good dummy load both of which are suitable for the frequencies being checked. And decent connectors, PL259s DO NOT figure here.

What you are doing relies upon unknown calibration of the repeater, coupled with the vagaries of propagation, which by itself is enough to cause the effects you are seeing.

When you have checked that, add a nineteen and a half inch "tiger tail" to the radio, and see how much better it works. And then try an outside antenna, and see how bad the receiver is.....

For a sub-$40 radio, it is the best radio you will ever have. Not perfect, but great fun. It may be flaky, but that is part of its charm.

Much better radios are out there, how deep is your pocket book?

Good luck and 73,

Stan, G4EGH

{SWR on an HT antenna means almost nothing since it .....snip}
Mike
If most of the power produced by ANY transmitter is being returned by the load, your have an inefficient system (ie; high standing wave ratio). What you speak of are skews in pattern etc by capacitive coupling with your body or nearby objects. You are correct in stating a 1/4 wave radiator needs a counterpoise to work efficiently, but to say swr doesn't matter is a gross misstatement that many newbies will think is gospel.

There are some real world tests , posted here very recently, that are fairly clear on what antennas work and which don't.
No disrespect intended, just prefer accuracy...

I was referring to the testing referred to by hooking up an HT antenna to an analyzer.

But you're right…I needed to be more precise….

Testing SWR on a ¼ wave antenna by plugging it into an antenna analyzer is horribly inaccurate. SWR will change depending where you stand or move the antenna. And lacking a counterpoise (i.e. the person holding the radio) will greatly affect the SWR.

51989. UV-5R Cable on a laptop vs a desktop

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-07 13:38:05 UTC
From: discowhale@...
Topic: 51989 Message: 51989

Hello Group,
I'm new to amateur radio, but I am NOT new to computers, peripherals, specified cables for unique eqpt and such. I was an I&C Tech, co-gen operator and spent 20 years doing electronic and computer controlled equipment installations and repairs. My wife is still working in computers and is a support tech daily. We both started WAY back with DOS machines with 51/4 drives, and have worked on everything in between.

I wrestled with the cable for 10hrs on a 2 y/o, Dell Latitude, Win7, dual core and no matter what drivers I used, no joy. It did not matter which of the USB Ports I tried to use, it never fully recognized the cable. My wife even tried a 'specialty driver disk' she carries daily.

We got nuttin' honey!

I'm disabled and my laptop is next to my chair in the TV room, so I kept banging away, instead of waddling to the desktop with a double handful of radios, cables, discs, etc.

I finally went into the other computer, and when I plugged in the cable to the desktop, Dell, Inspiron 560, Win7, dual core, it IMMEDIATELY recognized the cable, FOUND a USB to serial driver, autoloaded the driver.

When I started CHIRP, it found the radio, and did an upload from my UV-5R.

After 10hrs of total frustration and BS on a laptop, it took less than 90 minutes, to 'learn' CHIRP, add the repeaters and repeater specific settings, and get the spreadsheet saved and uploaded to two UV-5R radios that are now working like champs.

I understand that not everyone has multiple platforms laying around. But if you can't get the cable / radios talking to your computer, call a neighbor, call a friend, call a workmate, or family member who has a DIFFERENT computer than you have. Try the cable on THEIR box.

See if you get what I did. If you can't get your old gear and your new gear to play well with each other, you've eventually got to try something different. Just don't keep banging your head, time and attitude on the same stuff over and over.

At this point I wish I'd 'moved' sooner, my radios would have been up and running 2 days sooner. I blame ME for that the lost 10hrs, not Baofeng or miklor or Dell or whomever built the cable. As a retired technician, with 50 years of experience taking things apart and putting them back together, ALL over the world, I should have known BETTER.

good luck,
Steve in Central NC,

KM4MEF, check me out, I'll be just listenin' in.....

I know your pain. I use an IBM T30 for field radio programming (MaxTrac and Radius' talk DOS). But at the hotel, its Xp driven Wi-Fi card is unable to log into the network. Something about it not being up to date with WEP, WEP2, etc. I've tried to make it work and probably have made it worse. I'd love to just bring it back to what it was before I tried to fix it.

Any links on to how to undo my efforts or bring it back to square one would be appreciated.

My new 5R will not scan the CTCSS tones from an existing system I want to talk to.
I've tried Miklor's page, what am I doing wrong?

51995. Re: [baofeng_uv5r] UV-5R not scanning CTCSS or DCS

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-07 16:56:16 UTC
From: Jim Unroe
Topic: 51994 Message: 51995

With the latest firmware versions, the procedure has changed slightly.

The first change is that scanning can only be done in VFO mode.
The second change is that menu 10 (R-DCS) or menu 11 (R-CTCS)
[whichever you will be scanning] must be set to anything except OFF.

So once you switch to VFO mode and select any DCS tone or CTCSS tone,
then you can continue by following the miklor page.

Your experience demonstrates something that dinosaurs like you and me have learned about Windows machines but newer users seen unable to understand....

No two computers are exactly alike - even when they have exactly the same components and exactly the same software

In fact, no one computer is exactly like itself on two different occasions - even if nothing has been changed.

A long time ago, one of the basic tenets of computing was that if YOU did the same thing every time, the computer would also do the same thing every time. Somewhere along the development of Windows, that tenet became broken, which has made life a LOT more interesting ("interesting" in the same sense as the ancient Chinese curse: May you live in interesting times).

By the way, before I retired I usually told computer folks that I was "a DOS person who learned to tolerate Windows" but that isn't really quite true because I'm really a CP/M person who learned to tolerate DOS and then learned to put up with Windows.

I built my first computer -- not "built" as they call it today (plugging boards into a box), but BUILT, as in soldering individual resistors, capacitors, coils, and chips onto the boards of an Heathkit H89 -- and then upgraded the RAM from 48 KB (not MB) to the maximum 64KB using 8 memory chips and a paperclip.

Not tried that.

On the remote shoulder mic, I did try drilling out the hole in front of
the mic element. The guys on the other end tell me low audio.

I'm told that a Kenwood shoulder mic works nicely.

This was a Firmware change and I liked the ability to do this.

You will need to get an older firmware model now to scan or a real scanner

This still works on the new firmware. You just have to...

1. Be in VFO mode.
2. Set R-DCS or R-CTCS (whichever one you are scanning) to something besides OFF.

Then follow the instructions on the miklor website.

See below...)
---In baofeng_uv5r@yahoogroups.com, <marquis3@...> wrote :
I have been checking out the audio level of my new UV-5R using the Win System's internet streaming audio site. I get full locking on the repeater and no static but my audio seems very low compared to others.

I had this same issue. For some (most?) people, it is NOT an issue, as they traditionally seem to "yell' into their microphones. I like to speak in a conversational tone of voice, or amplitude. As a result, my UV-5R transmitted audio was poor, as compared to how my several other FM (and SSB) radios sounded.

I have service monitors in my home, so I was able to easily see the issue: Only if I would "shout" into the radio, would I get anything over 4 Khz of TX deviation. (And yes; -My radio is set to WIDE TX deviation...) I was seeing an average TX deviation of 2 Khz, being very generous...

I did notice that the UV-5R radio's TX audio was fine, but only if I used any of the various hand mics or headsets for these tests. (The TX deviation was then seen to be close to 5 Khz, plus the audio bandwith was fuller by far! -It "sounded" better, as a result.)

So, as the various new models of the UV-5R were being released, I would ask for reports on these newer ones, and the "reports" were that yes indeed, the newer ones had better transmit audio! So, I'd purchase a newer one, only to find that the TX audio was the same as the previous models. The only thing that seemed to be changed was the way the radio LOOKED.

Over the course of well over two years, I went through this same game, and ultimately, I purchased at least five "different looking" models of the UV-5R that seemed to have the same internal workings. (Ratz.)

I decided to try the UV-B5 radio. WHAT A DIFFERENCE!!! This radio has an easy 5 Khz of transmit deviation! The "transmit audio" gets me unsolicited positive reports. With the UV-B series, the internal mic now sounds as good as the UV-5 radios but only IF I USED AN EXTERNAL MIC. In other words, the UV-B5 and the UV-B6 sound like they should! They now sound like my other 2-meter radios!

I did not like the rotary knob on the UV-B5; I had read other reports and complaints about this nifty looking knob, but felt that this was simply someone else being too demanding, perhaps. So, I ordered one, anyway. (Guess what; -They were right.)

I exchanged my UV-B5 for the UV-B6. The UV-B6 has no rotary knob, but has the LED again! (Just like the UV-5R!)

The new UV-B6 also has excellent transmit audio! While this satisfied my main complaint of the UV-5R series, I was pleasantly surprised to find that the receiver is better in several ways, also!! The receiver in the new series seems to tolerate my strong RF field a LOT better, when I am close to my two-meter repeater. (The UV-5R radios would "fold up," in

this environment.)

I have purchased a second UV-B6 as a backup. It has the same extremely good performance as the other two that I had (have), so I am sold on the newer version of handheld, this being the UV-B5 or the UV-B6. (Plus, at less than $27 for the radio SYSTEM, no tax, shipping included... What is not to like!!??) By "system," I mean that for the $27, one gets the radio, antenna, drop-in charger and battery, etc.; -Just like the UV-5R series radio packages.

Being that I am now retired from commercial (airline and land) radio communications, I looked into modifying one of the older UV-5R series, but for the hit-and-miss modification to BYPASS WHAT SHOULD NOT HAVE BEEN INCLUDED, it just was not worth it. i sold all of the UV-5R radios.

Have tried both the internal mike and the external one attached to the
ear piece. Same problem. Is low audio typical with this this radio?
Is there any way to adjust the audio?

OK on this; I had GOOD transmit audio from my UV-5R radios, if I used an external hand mic or an external headset!

Bottom line: Try a UV-B5 or UV-B6. It is a good unit.

73; -Mike- K0JTA

You don't mention your radio's firmware version, but yours may be old enough to contain the "beep bug" which requires one to set Menu 8 to "On" in order to receive audio. It takes just a few minutes to try it and see if it works.

You CSV file looks fine. Download from your radio, save the channels
and settings as a native CHIRP Radio Images (*.img) file and attach
it.

I am confused here. Yes I am relatively new and did a search and found nothing on this.

Is there a way to get your average repeater to report the signal strength of the signal IT IS RECEIVING from your transmitter? That seems to be what Gordon is detailing and I have never seen this anywhere. I am aware of the variables of the RST and the various paths that contribute to the quality of the signal you receive FROM a repeater.

---In baofeng_uv5r@yahoogroups.com, <stanwhite_snr@...> wrote :

Can't speak for the programming issues, but for the power issues, the ONLY way to check is with a known good power meter, into a known good dummy load both of which are suitable for the frequencies being checked. And decent connectors, PL259s DO NOT figure here.

What you are doing relies upon unknown calibration of the repeater, coupled with the vagaries of propagation, which by itself is enough to cause the effects you are seeing.

When you have checked that, add a nineteen and a half inch "tiger tail" to the radio, and see how much better it works. And then try an outside antenna, and see how bad the receiver is.....

For a sub-$40 radio, it is the best radio you will ever have. Not perfect, but great fun. It may be flaky, but that is part of its charm.

Much better radios are out there, how deep is your pocket book?

Good luck and 73,

Stan, G4EGH

No. Most repeaters are not capable of doing that.
You will probably have to get another user to tell you how noisy you are
into the repeater.

I agree that it would be best to have a calibrated power meter. Failing that, I use what's available to me: a repeater that speaks back an S-meter reading.

I enter DTMF code 699 to trigger the response. This is documented on page 2 of this document: http://archive.k6ya.org/docs/Fars-Net-Script.pdf

I'm running RMS Express and can successfully send and receive emails using the Internet.

I have VOX set to 1 and am tuned to the correct station. The closest station is only about 9 miles away and I can hear it transmitting packets from other stations. When I plug in the two cable connectors to the MIC and SP ports of the UV-5R and then turn the radio on it almost immediately goes into TX mode and stays there before I even start a session on RMS Express. My squelch is currently on 3. Any suggestions on the correct settings for VOX and Squelch would be appreciated or anything else I can try to make this work.

Because the problem is in the "main" part of memory, you should be able to "fix" the radio with any available "factory" CHIRP Radio Image file that came from a radio with N5R firmware.

Use the CHIRP daily-20140714 version of CHIRP to do the upload. Towards the end of the upload you will get an alert something like the firmware version of the image and radio don't match. This is expected. But the part that does the repair will have been uploaded.

Once it is determined that the radio receives again, then upgrade to the latest CHIRP daily.

Hi Ed. No. If I just plug in the MIC by itself or the SP by itself, the radio does not go into Transmit. I am only having the issue when the MIC and SP are both plugged into the radio at the same time.

The radio will do this regardless of whether I have the VOX set to 1 or 10.

If I set my VOX to zero (off) I do not have the issue. When I start a transmit with RMS Express the TNC keys the radio as it should and the radio goes into transmit. However, the radio then stays in transmit and won't come out of transmit until I manually turn the radio off. The session times out and disconnects but my radio stays in transmit.

Also if I have both MIC and SP plugged into the radio, VOX on and the other end is not connected to the TNC, the radio does not go into transmit mode. If I connect the radio to the TNC with the TNC powered off the radio does not go into transmit mode. The radio only goes in to transmit mode on its own when the TNC is powered on and the VOX is also turned on.

Hi Ed. No. If I just plug in the MIC by itself or the SP by itself, the radio does not go into Transmit. I am only having the issue when the MIC and SP are both plugged into the radio at the same time.

The radio will do this regardless of whether I have the VOX set to 1 or 10.

If I set my VOX to zero (off) I do not have the issue. When I start a transmit with RMS Express the TNC keys the radio as it should and the radio goes into transmit. However, the radio then stays in transmit and won't come out of transmit until I manually turn the radio off. The session times out and disconnects but my radio stays in transmit.

I'm running RMS Express and can successfully send and receive emails using the Internet.

I have VOX set to 1 and am tuned to the correct station. The closest station is only about 9 miles away and I can hear it transmitting packets from other stations. When I plug in the two cable connectors to the MIC and SP ports of the UV-5R and then turn the radio on it almost immediately goes into TX mode and stays there before I even start a session on RMS Express. My squelch is currently on 3. Any suggestions on the correct settings for VOX and Squelch would be appreciated or anything else I can try to make this work.

Interesting and DISAPPOINTING!
I had written my response and then deleted it, to corrected the typos and so on, posted and deleted it again... I did this several times, DELETE and RE-POST the updated...

Each time, I had assumed that it was indeed DELETED, but it was not! In today's digest, I see many, MANY similar-looking posts from me; The "deleted" were not deleted, after all!!! (Even though it appeared to be the case on-line in the Yahoo group web site...)

Sorry for what appear to be multi-posts of the same! The LAST one is my several-times-corrected version. I guess the DELETE MESSAGE is non-functional.

Our group is using the Arcom controllers for our repeaters. If your local repeater IDs in voice
it is likely an Arcom. With a little engineering you can set up the S-meter function on the Arcom
but there is a cool function available to all users that is a basic part of the function of all Arcom
controllers that is quite useful.

Control functions for the repeater are reserved for the repeater
control operators that are designated by the repeater owner but lower functions are available
to all users if the repeater owner wishes. The Arcom RC210 not only can read out status and
function confirmations in voice but is capable of recording announcements and custom IDs.
You can also set it up to repeat a short audio segment upon command with a "macro" command.
The default is to send four DTMF "A"s. The repeater then comes back with "ready" then
whatever you transmit back for the next 20 seconds or so is then temporarily recorded and
transmitted back. This is great to hear what you sound like and to see if you are full quieting
into the repeater. This is a neat function to have when everyone is busy and you can't get someone
to come back and give you a signal report at 3am.....

BTW A is sent when you press the "menu" button on the UV-5R while transmitting.

Yeah... Once you post a message and it gets sent out via email, there is no calling it back. It is only the few members that use the web interface instead of email that will only see the "final" post.

Attachments: 1 described; binary payloads are missing from this source WARC

I explained above. Any of the 'factory' N5R images should work. You
won't change the firmware. The firmware is not changeable. You are
changing the memory.

Please don't say "I tried a couple". It tells of nothing. Tell us
exactly what you have tried.

Download and install the CHIRP daily-20140714
Save the attached "patched" file and upload it to your radio

If it is fixed, reinstall the latest CHIRP daily build.

52040. RE: [baofeng_uv5r] Scrambler function UV-5R

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-08 17:53:08 UTC
From: Geoff
Topic: 52016 Message: 52040

Weeelll, not always. There are digital scramblers kicking around as well.

Various digital speech modes are effectively ‘scramblers’ if you don’t know what it is or how to listen to it. Not secure as such, but the effect is similar.

Scramblers are prohibited for amateurs pretty much everywhere I think, but digital voice modes make pretty good scramblers intentionally or not.

Interestingly, Australian CB (27mhz and UHF) permits the use of scramblers but not (AFAIK) digital speech modes.

> issue when the MIC and SP are both plugged into the radio
> at the same time.

THIS part of your problem is simple enough to diagnose and that MAY lead you towards a solution.

This is happening because the sleeve on your MIC plug and the sleeve on your SP plug are connected to each other - if this happens with ONLY the radio end of the cable connected then whoever set up the cable apparently assumed both sleeves were 'ground' level connections - which is fine for some uses but NOT on a Kenwood or any of the Chinese radios that copy their system.

Many years ago that is how such speaker jacks were originally designed - with the sleeve part of the jack normally connected to the chassis ground. Later equipment manufacturers started using the same style connector for a mic jack and still let the sleeve be chassis ground and connected to the shield of the mic audio.

Gradually the concept changed - mostly just because the "chassis" that these plugs were connected to mostly became plastic - and the sleeve connector in the jack required being actually connected to something. But it still tended to be treated as the ground or common side (especially for speaker connections)

Then along came Kenwood who figured out that they could save one whole jack (a couple of cents wholesale, but more valuable for the space it takes up) by eliminating a separate PTT jack and making the PTT circuit use the sleeve of both the mic and speaker jacks.

Hi Brad and Jim - I am having problems getting my UV-5R to work with my TNC-X. I am just trying to send and email using RMS Express.

When the TNC-X keys my radio, the radio gets stuck in TX and will not stop unless I physically turn it off. If I have the VOX set at 1 through 10, my UV-5R goes into TX mode right after I turn the radio on even before it's keyed by the TNC. I have no idea what I am doing wrong. Any info would be much appreciated.

Hi Brad,

This is a common problem. The RF from the radio is causing the TNC to lock up the TX circuitry.

There are a number of things you can try:

Shield the TNC-X (if it is not already shielded). Put ferrite beads on all of the cables to the TNC, especially the cable between the radio and the TNC. Use an external antenna to move the RF energy away from the TNC. Sometimes a better HT antenna helps.

Even for TNCs designed to be used with an HT, the Baofengs can at times be bit a bit problematic. They tend to send a lot of RF energy into the speaker/mic connector.

Kind Regards,
Rob wx9o

Good deal and thanks a ton Rob. Ordering some beads now. If that doesn't do it I'll try a different antenna setup. And if that doesn't do it then I'll have to get me another radio, which isn't all that bad! Have a good weekend.

When you do an in-place upgrade to Windows 10, the Prolific device driver is upgraded to the latest version. So if you previously had to downgrade to the Prolific v3.2.0.0 device driver, you will have to do it again.

Oh... and there is a good chance that the COM port number may have changed. That would make the COM port number that CHIRP remembers from session to session invalid, giving you the error you see.

Sorry I'm new to this i reset the radio via the settings i downloaded the daily build of chirp i downloaded the file N5R-20(140525N)(factory) and downloaded a csv file i created with chirp csv creator

i connected the radio to my computer downloaded the radio image and saved it to my computer imported the N5R-20(140525N)(factory) file and uploaded to the radio then i imported my csv file with the 2m and 70cm repeaters that i want to use uploaded to radio then i checked memory 8 and it is on i connected radio to my big aerial which i can open my local repeaters and gb7ok which is 67 miles away so i should be able to open 2 repeaters one 1 mile away and one 10 miles away but the uv5r still can't open the repeaters or when i open the local repeaters with my other handheld i don't hear the repeater open on my uv5r

I'm not sure that I even need to use VOX. When I have VOX turned off the TNC-X keys the radio just fine. It's just that the radio won't come out of TX mode after it's keyed. The RMS Express session times out and terminates but the radio is still keyed.

  Hi Brad and Jim - I am having problems getting my UV-5R to work with my TNC-X. I am just trying to send and email using RMS Express.
When the TNC-X keys my radio, the radio gets stuck in TX and will not stop unless I physically turn it off. If I have the VOX set at 1 through 10, my UV-5R goes into TX mode right after I turn the radio on even before it's keyed by the TNC. I have no idea what I am doing wrong. Any info would be much appreciated.

Hello again.

I understand that the radio does *not* go into Transmit when the radio cable is plugged in to both the Radio and the TNC-X as long as the TNX-X is OFF. But when you turn the TNC-X ON with this configuration, the Radio goes into Transmit - IF the Radio is in the VOX mode. If the VOX mode is turned off on the radio and it's in the PTT mode, the radio does *not *go into Transmit. All of this sounds like things are working as they should - so far. You should not need to be in the VOX mode because you are using the PTT line from the TNC-X. (Please correct me if I have any of this wrong)

But... from reading your other emails, it sounds like - with the Radio in the PTT mode - it can be actuated by the TNC-X normally, but it will not go out of Transmit at the end of the message. If this is true, it does sound like RF getting into the TNC-X. An easy way to check this is to transmit into a dummy load (no RF radiation). If things behave normally, that's your problem and RF beads and/or bypass caps inside the TNC-X should help. It would also help if the radio cable were shielded.

Keep at it, Brad, you're not far from getting the operation you're looking for.

Forsale: Icom IC 7800 & ICOM IC 756 PRO 3 with ICOM PS 125.

Callsign: KJ6DBP
Email: kj6dbp@usa.com

Icom IC-7800 Low usage in Non Smoking Environment.
This rig has always been covered when not in use.
The rig is in mint as new condition.

Icom IC-7800 version 2 with 3 Roofing filters (15,6 & 3 kHz) and current 3.10 firmware.

Also included:
Icom SP-20 Speaker
Heil PR 780 dynamic cardioid microphone
Heil Pro Set iC boom/mic/headset combo
Heil HMM-iC hand mic
Heil HS-2 hand switch
Heil CB-1 mic base stand

$4,350 and you'll pay the shipping fee.

ICOM IC 756 PRO 3 and ICOM PS 125 matching Power Supply for sale.
Also Included:
Icom Manual, Power cord, Nifty Mini Manual, Icom HM 36 had mike and original brochure.
This radio is in excellent condition, has lived in a non smoking household and has no repairs and or modifications. I am the original owner.

$1,300 and you'll pay the shipping fee.

Also Windows 10 forces mandatory upgrades/updates as part of the user agreement. If someone is having to use a downgraded Prolific driver, Win 10 will not allow them to keep it based on the new user agreement as I understand it. This is already creating issues for people who require less than current drives for various peripherals.

52067. Newest Chirp Not Recognizing All Comm Ports

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-09 16:01:42 UTC
From: cprendon@...
Topic: 52067 Message: 52067

I just upgraded from Chirp 20150312 to 20150702. Now it only recognizes the single highest numbered comm port cable I have. I have 3 FTDI genuine cables Comm 13, 17 and 18. This newest Chirp only lets me pick 18 even with a radio connected and on at 13. 18 does work. Even when I select an image that defaulted to comm 13 to upload it now only shows 18. I am running Win 7/64 and all three cables/ports are visible without errors in device manager.

Anyone seen this? I have closed and restarted Chirp in case it has to initialize the first time. I tried searching this but everything out there is about the problems with UV5R connections and drivers. All was working 5 minutes prior until the upgrade. Just checking before a downrev to the prior version which worked.

52068. Re: [baofeng_uv5r] UV5R Variants with Same Firmware

Topic: 52064 Message: 52068

Currently that is how CHIRP works. It considers variants like the BF-F8+ and the UV-5RA the same as a UV-5R.

UV-5R variants:
http://chirp.danplanet.com/projects/chirp/wiki/Baofeng_UV5R_Variants

If all 14 bytes of the firmware version stored in the image file exactly match the 14 bytes of the firmware version of the radio, the upload will begin (no matter what is printed on the badge of the radio). If the image version and radio version do not match (even if the model on the badge is exactly the same), then the upload will be aborted and a message displayed showing the difference between the versions.

If what you are saying is true, then you would be able to downgrade back to 20150312 and all will be well again. My guess is that something else has changed and the CHIRP upgrade is just a coincidence.

52072. Re: Newest Chirp Not Recognizing All Comm Ports

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-09 16:40:05 UTC
From: cprendon@...
Topic: 52067 Message: 52072

There are no installation instructions pertaining to installing over previous versions, so I assume that Chrip overwrites with no problem which is what I have been doing.. That an uninstall is not required before a new install.

To help troubleshoot I removed all cables, upreved again and it recognized the last cable used. Previously 18 was the last cable used and this time before the uprev it was 13. 13 showed in the down/upload selection and nothing else was available even though 13 was not plugged in. I tried it and of course it did not work. I plugged all 3 cables in and still it only recognized 13 which then did work.

I downreved again and again all is working fine. It seems that for whatever reason Chirp only recognizes the last comm port cable used in the previous installation at least on my system which is quite vanilla. I am not one of those people who installs software willy nilly. I am very careful where it comes from and I only install what is needed. The only thing I did not try was disabling my antivitus software (MS Security Essentials) before installing, but I have not heard of Chirp having any issues with AV conflicts.

You forgot to mention the snooping it does on your computer to search for bootleg torrents and other software with the ability to create a listing of what you have that might have been downloaded or shared but possibly not paid for.

I’ve read this info can be reported to authorities, including other items on your computer that they THINK you should not have.

A good reason to hold off for an upgrade if you have odd ball radio programming files and copied a paid disk you bought to your computer for backup will those Chinese factory programs be flagged?

Too evasive , if these reports of the snooping and the Google styled advertisement reporting methods are true. .

Go read some of the warnings about the security and privacy issues.

All of it makes me want to hold off doing an upgrade.

Also Windows 10 forces mandatory upgrades/updates as part of the user agreement. If someone is having to use a downgraded Prolific driver, Win 10 will not allow them to keep it based on the new user agreement as I understand it. This is already creating issues for people who require less than current drives for various peripherals.

Reports of problem, yes I heard it before and was repeated after the stock market crash with more details.

It seems some of the part suppliers have a problem- they have been supplying parts for companies like Baofeng for a long period at the lowest reduced prices as possible,

Inflation and other reasons have made the profit margins too low and some were under a time contract to provide materials at a set price.

I guess some decided it was not worth it, either decided to get more money from their parts buyers (Baofeng) and/or decided just to shutdown when the negotiations failed.

Therefore, it is both the part suppliers and Baofeng itself that are having problems this shortages.

Info is Sketchy about this, I just know some places are shutdown and sitting idle.

Where you see the shortages is where you need to stock up if you need spares. Always a good idea to have spare batteries, an extra charger- things like that.

Yes, from what I've read that is a big issue with Win 10. My wife found an article describing how invasive it is and how to shut down all the things it wants to monitor and report so I did that as soon as I downloaded it.

This link should make it possible to install the right older drivers and leave them there.
http://www.howtogeek.com/223864/how-to-uninstall-and-block-updates-and-drivers-on-windows-10/

I also recall a setting to keep from downloading but can't seem to find it now.
Also setting your wifi connection to metered will keep most updates from downloading.
I expect that Microsoft will get enough complaints they may back off on the forced updates

This is correct. The CHIRP installer basically deletes everything in
the folder and then extracts the version being installed in its place.

>
> To help troubleshoot I removed all cables, upreved again and it recognized

CHIRP remembers the list COM port selected in its configuration file.
If the next time you launch CHIRP the comport of the programming cable
changes, the last port used will still be selected.

That being said, the new COM port should be listed and you will have
to select it from the list.

Every once-in-a-while I have CHIRP stall on an upgrade because a file
is in use. If I stop the install and start it again, the 2nd time
always seems to work.

Glad to hear it.

I keep multiple drivers installed on my Windows 7 64-bit computer for testing purposes. The other day when out-of-the-blue my Windows upgraded my driver, it was a simple matter to go into Device Manager to select the v3.2.0.0 driver again per the instructions on the miklor.com website.

Jim

Imagine this scenario:

You sold a radio to someone with a whopping $10 profit. Radio was pre-programmed for the area.

They constantly called you every day because they screwed it up- or wanting tech assist,

After resetting their radio a few times- you decided to tell them to install software (chirp because they are too cheap to pay for RTS) so next time they could fix for themselves.

They show up and claim the Chirp file you gave them was a virus because Norton’s flagged it as a “reputation” issue.

...So you install and fix their computer correct drivers etc.

Next a few weeks later windows updated the driver- as you mentioned below – so they claim you must have did something to their computer.

Constant calls- you finally Block their phone number

These are some of the characters we get here.

On another issue what causes the oddball Memory spot 0 error? A certain radio someone has seems to lose the channel 0 setting and puts back a default of 136 mhz

Does anyone know why this happens and is an error with that particular firmware release or is it an op error issue with the operator adjusting improperly some type of settings?

I keep hearing this from time to time. I have used channel 0 here for
over 3 years. I have never once had channel 0 disappear on me. Without
being able to duplicate this issue, I am unable to speculate whether
it is a firmware bug or something unknowingly caused by the operator.

Is it just me, or is the percentage of d...heads buying these in some way disproportionate? There must be a hundred people with these in town here. All bought off ebay from China – this includes virtually every ham in town BTW, there simply aren't Hamventions or Gun shows or whatever it is you have over there, over here in Oz. I got my advice on how to set them up from another ham (Chirp, $7 cable, better antenna etc) and had very little trouble getting it up and running with all the relevant frequencies/repeaters etc. I've been a tech and a ham and worked with computers a long time and use this stuff daily, and to be honest I really didn't expect much trouble (how hard could it be right? I've messed with Motorola radios quite a bit so computer based stuff – some of it requiring real DOS and slow hardware and actual serial ports to work reliably) is no big deal to me. But it seems the majority of people are using them on UHF CB (not strictly legal as it's not type approved) but none of them seem to have the issues you are reporting, yet some of these folks are at best, technically challenged. I know one guy that has one that's barely literate, someone else apparently programmed up the radio for him, but he just uses it and doesn't mess with it and naturally it works fine. The only time he's had trouble is when he left it in a car and it got pinched. So he got another one. Don't know who did his programming, but I did notice that he's locked out tx on any frequency except the UHF CB ones, but he's got a lot of ham and marine stuff and some commercial frequencies (you can't put cops on it, they use digital trunking with mil grade encryption) and he likes to listen in to that stuff.

Chirp is the software of choice, all the ones I've spoken to at least know its name (never heard of RTS here – not surprisingly) even if they can't or don't use/need it.

I can't believe there is such a wide discrepancy or that people are so demanding – not sure what's driving that.

When you join the users group, the moderators have gone out of their way to emphasize looking at the FAQs and go to the Miklor site. It seems obvious to me that not everybody seems to have done that. How many times has the same question been asked, immediately after it has just been answered? Some people have to be told time and time again about such things as the proper firmware or setting the Prolific driver back to 3.2.0.0. They just don't want to listen. If everyone did follow the suggestions presented to them, the traffic on this user group would be cut down at least 90%. It is actually refreshing when a NEW question comes up. I think people should have to have a notarized statement saying they have checked the FAQs, Miklor site, and previous "conversations" on the user group page. Maybe these guys just want everything handed to them without having to do any work themselves.

Apparently it happens when to gods of radio are not smiling on you.

I have seen it happen on ONE of my UV-5R radios - ONCE - the radio had been programmed with VIP and had worked fine for at least a month, then suddenly channel 0 changed to some strange simplex frequency (perhaps the same one that it originally had from the factory, perhaps not - I don't recall what the original frequency was and didn't pay close attention to what it magically became that one time.) I reprogrammed the radio with VIP, using exactly the same file that I had saved before programming it before. It never did it again. The other radio never had that problem.

I've heard reports of other instances of the UV-5R magically forgetting Channel 0 -- for some people reprogramming the channel fixes the issue and it does not recur; some other people seem to have it happen randomly. I have never heard of anyone who has it happen in any specific repeatable pattern. My advice to people who have it happen more than once is to stop using Channel 0. I have never heard of a similar problem with any other channel in these radios.

This email has been checked for viruses by Avast antivirus software.

Yes same here, I was told the owner of the radio likes to play with it changing settings often. I wonder if he is actually deleting the memory and the channel goes to a default 136 mhz setting as a placeholder.

I cannot get mine to do this so I am stumped too what is going on.

I keep hearing this from time to time. I have used channel 0 here for
over 3 years. I have never once had channel 0 disappear on me. Without
being able to duplicate this issue, I am unable to speculate whether
it is a firmware bug or something unknowingly caused by the operator.

Well that observation is not too far off with the experience at our tables. At least in here many of the Hams are helpful and take turns answering the same questions.

The users requesting help generally will be polite in their request – to insure they get some type of help

Now CONTRAST that to have 2 or just 1 person at a table with someone yelling at that “This piece of crap broke my computer or I cannot program this MoFO.”

Imagine a loud voice and demands from people that never bought it from you in the first place along with HURRY UP I got somewhere to go- DID YOU FIX it yet?

Also imagine they expect this to all be free too with a reply such as: “I only paid $30 bucks for it, why should I pay $25 for you to program it for me (or fix a problem.)

On top of that, imagine that while you are dealing with these types..others are stealing stuff off your table, trying to exchange bad batteries or antennas at the same time.

The great thing about this is – You just can delete the Email—in person the best you can do is call security to get rid of the drunks or tweakers wanting their radio fixed for free.

The real jolly is dealing in real time with some of the people behind the magic internet curtain.

When you join the users group, the moderators have gone out of their way to emphasize looking at the FAQs and go to the Miklor site. It seems obvious to me that not everybody seems to have done that. How many times has the same question been asked, immediately after it has just been answered? Some people have to be told time and time again about such things as the proper firmware or setting the Prolific driver back to 3.2.0.0. They just don't want to listen. If everyone did follow the suggestions presented to them, the traffic on this user group would be cut down at least 90%. It is actually refreshing when a NEW question comes up. I think people should have to have a notarized statement saying they have checked the FAQs, Miklor site, and previous "conversations" on the user group page. Maybe these guys just want everything handed to them without having to do any work themselves.

Is it just me, or is the percentage of d...heads buying these in some way disproportionate? There must be a hundred people with these in town here. All bought off ebay from China – this includes virtually every ham in town BTW, there simply aren't Hamventions or Gun shows or whatever it is you have over there, over here in Oz. I got my advice on how to set them up from another ham (Chirp, $7 cable, better antenna etc) and had very little trouble getting it up and running with all the relevant frequencies/repeaters etc. I've been a tech and a ham and worked with computers a long time and use this stuff daily, and to be honest I really didn't expect much trouble (how hard could it be right? I've messed with Motorola radios quite a bit so computer based stuff – some of it requiring real DOS and slow hardware and actual serial ports to work reliably) is no big deal to me. But it seems the majority of people are using them on UHF CB (not strictly legal as it's not type approved) but none of them seem to have the issues you are reporting, yet some of these folks are at best, technically challenged. I know one guy that has one that's barely literate, someone else apparently programmed up the radio for him, but he just uses it and doesn't mess with it and naturally it works fine. The only time he's had trouble is when he left it in a car and it got pinched. So he got another one. Don't know who did his programming, but I did notice that he's locked out tx on any frequency except the UHF CB ones, but he's got a lot of ham and marine stuff and some commercial frequencies (you can't put cops on it, they use digital trunking with mil grade encryption) and he likes to listen in to that stuff.

Chirp is the software of choice, all the ones I've spoken to at least know its name (never heard of RTS here – not surprisingly) even if they can't or don't use/need it.

I can't believe there is such a wide discrepancy or that people are so demanding – not sure what's driving that.

Jim

Imagine this scenario:

You sold a radio to someone with a whopping $10 profit. Radio was pre-programmed for the area.

They constantly called you every day because they screwed it up- or wanting tech assist,

After resetting their radio a few times- you decided to tell them to install software (chirp because they are too cheap to pay for RTS) so next time they could fix for themselves.

They show up and claim the Chirp file you gave them was a virus because Norton's flagged it as a "reputation" issue.

...So you install and fix their computer correct drivers etc.

Next a few weeks later windows updated the driver- as you mentioned below – so they claim you must have did something to their computer.

Constant calls- you finally Block their phone number

These are some of the characters we get here.

On another issue what causes the oddball Memory spot 0 error? A certain radio someone has seems to lose the channel 0 setting and puts back a default of 136 mhz

Does anyone know why this happens and is an error with that particular firmware release or is it an op error issue with the operator adjusting improperly some type of settings?

No Geoff you are correct

Most experienced Hams buy these as secondary experimental radios or toss aways. They most likely already know how to read and understand info from well-written sites like Miklor.

A high percentage of people who buy these from me are generally those that are prepper types – not wanting to invest big money into a first radio, most of them end up becoming well informed Hams. The type you mentioned are the third type , and you can call them, general real cheapskate deadbeat types.

Craig calls them “dumpster divers” they generally are very cheap and expect everything given to them for free. Not sure if these types exist to large quantity in Aus/NZ/UK but in the USA we created a whole generation of them dependent on someone else (usually the government) with someone doing everything for them.

They will expect a large amount of service or product for nothing. I been getting better at ignoring them and dealing with better customers.

The $30 crowd also expects something that is the same as an $800+ radio. Many times I deal with idiots that will ask me “Can this pick up CHP and talk around the world like my Cobra CB and get 49 + miles like my pair of Wal Mart radios, along with talking with my satellite phone and Facebook? As soon as you politely got rid of them another steps up with the same questions or poor attitudes.

Where would you start with an idiot like this? You have to explain repeaters, frequency bands, wave theory, LOS communications everything. In the past we did this, wasting a large amount of time on someone to find they will show up at the next show with an Amazon.com discount special asking us to program it and teach them how to use it.

A normal person would view this type of behavior as not socially acceptable- but the Obama government dependent generation types do not. They see no socially inept stigma with trying to cheat you or switch parts at the table that maybe costs $5 for a replacement. In the past we allowed people to bring radios in to insure the headsets, and batteries and antennas fit as the quality varies from some of the crap found online. We found a few of the Deadbeat crowd or Dic...ds as you called them would use this chance to change out bad parts or even switch complete radios out and leave them to get a newer one..

Add that to the fact these radios can go into the Police/Fire VHF and lower UHF ranges, we get dozens of Los Angles gang members and drug dealers at our table looking for something to monitor and jam police communications if possible for drug dealing and other activities. I am talking about people with gang membership tattoos right on their foreheads.

Much different than dealing with the oddball geeks you might run into at the Hamfest swap meets. Generally, I do not mind being a vendor or shopper at those places.

Some of these places I am wondering if the tires will still be on my car when the show is over.

So the bottom line, I really hate to admit it..but you're right the UV5R type person, that never wants to get licensed, learn anything, or read info on places like Miklor and argue that something is $1 cheaper on Amazon are generally society misfits. I think at a very higher percentage than your Yaesu, Kenwood, Icom, or Motorola buyer types. Even the Wouxun and TYT crowds/buyers are much better than the uv5R groupies.

It is the cost of the radio- too cheap you get the mentality of the FRS/GMRS crowds and people that would not buy them if they were hundreds of dollars instead of $30.

I am very tempted to wear and record my Mic cam on some of the characters I deal with then put it on You Tube. The next drunk we get that is yelling and telling us he reported us to the FCC because we do not restrict the VFO to Ham only operation or demand everyone show proof of being licensed- will go on YouTube. That will also include those asking our call signs and license numbers to do a spot check on us.

I am not sure if these people exist elsewhere, but in the Peoples Republik of Kalifornia they exist.

I think I might move channel zero as a precaution- as I think it is a keystroke error causing something to dump .

Channel 0 is his main repeater, so having it change on him is disruptive. That whole Cert group has the same program so I hope switching two channels will not be confusing for him.

Apparently it happens when to gods of radio are not smiling on you.

I have seen it happen on ONE of my UV-5R radios - ONCE - the radio had been programmed with VIP and had worked fine for at least a month, then suddenly channel 0 changed to some strange simplex frequency (perhaps the same one that it originally had from the factory, perhaps not - I don't recall what the original frequency was and didn't pay close attention to what it magically became that one time.) I reprogrammed the radio with VIP, using exactly the same file that I had saved before programming it before. It never did it again. The other radio never had that problem.

I've heard reports of other instances of the UV-5R magically forgetting Channel 0 -- for some people reprogramming the channel fixes the issue and it does not recur; some other people seem to have it happen randomly. I have never heard of anyone who has it happen in any specific repeatable pattern. My advice to people who have it happen more than once is to stop using Channel 0. I have never heard of a similar problem with any other channel in these radios.

One time I had forgotten to close Chirp before the upgrade and I did get a file lock error. I just closed it and then it ran completely. Every other time the installer ran to completion.

It is strange that the only comm port it would recognize was the last used. It just never interrogated the available ports.

Since you said that the installer actually does an uninstall I won't do it manually. It must leave a config (or something) file behind though or how would the new version know the last comm port from the previous install of Chirp. I just wonder if that file may be an issue since it is the only thing left behind.

Every once-in-a-while I have CHIRP stall on an upgrade because a file
is in use. If I stop the install and start it again, the 2nd time
always seems to work.

I can tell you from experience that trying to find an issue in past conversations in the group is near impossible unless someone knows a trick to it. Other reference/help resources are wonderful. I could not have gotten my Baofengs running without miklor.com. I recently taught an Elmer class for beginners at a licensing session and held up the manual for an FT60R and then a UV5R (out of the box) and people were amazed at the difference in the number of pages in each. And the FT 60R is relatively basic. The first thing I taught them about Baofengs (almost everyone had one) was to go to miklor.com.

The problem with group conversation searches is that searching key words yields so many unrelated results and the same with searching subjects that it can be useless. The files library is pretty good though. Occasionally it works, but consider how many off-topic responses there are in almost any subject. When you have humans writing you get a loss of organization and consistency. We tend to be a rambling species sometimes... Now where was I going with this?

Use the technique to find the debug.log file to find the special
folder where the config file is. You can delete the config file (what
I do is rename it) whenever you want CHIRP to create a new one.

It doesn't have anything to do with the shipper, but it is a way of getting the goods past the import duty/tariff charges that would be imposed by the US Customs Office. Gifts , toys and a few other categories are not charged import duties. Radios, batteries, radio accessories etc are all on the US Customs duty list and would be charged full tariff rates, which could be as high as 15% of the items value.
You will also see in many cases that the declared value is either nothing, or very low, just in case the US Customs opens the package to see what is inside. The tariff fees are collected from the recipient of the package if Customs does enforce the import tatiffs Kurt -K5KJK

Kurt is correct, plus there are more shipping restrictions on LiIon batteries. Until Customs actually starts to inspect every package many Chinese sellers will mis-identify products on purpose to reduce their costs.

From: Mark Tyree
Topic: 52113 Message: 52113

I want to hang an antenna from a high tree. I have an 80 ft length of coax, so my question is, how much power am I going to lose due to resistance as it travels through the coax? Is it even worth using or do I need to hook up an amp to it?

52114. Can you hear me??????

Yahoo group: baofeng_uv5r (2015)

How do you propose an amplifier in one direction ? you can see the attenuation of the cable that you propose from the charts for the specific cable
and then think if possible to reduce length to a feasible value.

52116. Re: Coax length?

Topic: 52113 Message: 52116

What type of coax? Each type has a different amount of loss.

For example, at 100 MHz, RG58 has 4.9db of loss per 100 feet. RG58X has 3.6db. 9913 has 1.4db.

Ball park - every 3db is double/half the signal gain/loss. So if you had 100 feet of RG58x, you would have a little over half the signal at the far end as at the near end.

However, I believe antenna height more than offsets coax loss in most cases. Put the antenna as high as you can, and use the best coax you can.

As to using an amplifier - do you mean for receiving or transmitting? For receiving, you want the amp to be as close to the antenna as possible. For transmitting, all other factors being equal it takes 4 times the power to double the range. But putting a good antenna up higher is not all other factors being equal, and generally that will more than offset the power loss through the coax for transmitting as well as for receiving.

Lastly, but maybe most important, is who/where do you want/need to talk to? If you are going for a specific repeater or other station on simplex, then just build enough antenna to get the job done.

FYI

The customs charges I got on my last DHL shipment was $160 . Divided into the 8 QYT 8900 radios and 5 TYT F9D tribanders comes out to 13 radios/160 = $12 extra per radio

That is $12 higher than the Lowest Amazon prices, so when you see these extra charges do not think the radio seller is making big bucks. It is not going to them unless they are a commercial dealer selling to Government entities.

The Customs Officials have been very over zealous recently squeezing out as much as they can. I wish Immigration-Customs-Enforcement ICE would be this zealous on protecting our border.

Most likely not worth it, you need to look at an attenuation chart and then a LOS height calculator.

If you are going to buy a mobile in the future then it might be worth doing, I would not sure anything lower than LMR 400 for the run with the best antenna you can buy.

Today I put a 3 element dual band Yagi that used Gamma match coupling , I was really getting the repeaters I usually get with a high noise floor. It really makes a big difference. You need to determine if you want something directional with rotation or Omni directional.

Example: You want to run simplex from your cabin to a location far away in the hills where you go hiking or hunting. It would be to use a directional antenna at your cabin to connect to the base camp in the hills.

Here on one of the repeaters a jamming and “biggest radio” war has started with many involved building their own antennas to get something over the next guy. When they try to talk they just key over them.

Quite entertaining to listen to

"Most repeaters any more have ctcss tones to keep them from being activated
by unintentional radio traffic"

There's also the possibility of unlicensed radio traffic as well, as some
folks think they'll just program the radio "for emergencies" so why bother
getting that pesky license?

You could be transmitting on the wrong frequency.

You could be too far away.

But the most likely reason is that they are using a receive CTCSS tone (or receive DCS code) to limit their reception to only radios that are transmitting that matching tone(code). Until you program your radio with and transmit the matching CTCSS tone (DCS code), they will not hear you. That's how it works, and why it is used.

You could start either by reading the user manual and FAQ on the Miklor website then learning enough about radio to understand what you read on the website; or you could learn enough about radio to get the license, then read the user manual and FAQ.

I do believe CG-1889 is RG-213 so you're at 2.8dB per 100ft for 144MHz or about half the power is lost traveling one pass through the coax.
And that loss calculation assumes an SWR of 1 because if you also get reflected power from the antenna you lose more as the signal bounces back and forth.
e.g.10W -- 3dB coax loss -- SWR 1 = 2.5W out10W -- 3dB coax loss -- SWR 2 = 2.5W,
With SWR 2 -- At antenna -- 5W becomes 2.5W and reflects 11.1% or 0.2775W,
One the way back to the rig loses 3dB and becomes 0.13875W at rigRig reflects back and another 3dB loss means 0.069W at antennaAntenna reflects back 11.1% again or 0.008W and we can pretty much stop there as we're in the noise.
So you end up with 2.5W - 0.2775W + 0.13875W or 2.36125W
If your SWR is < 3 you'll probably gain quite a bit moving the antenna up high even with the ~50% loss. Amplifier probably not necessary.A 3dB loss or so is easily made up by a better antenna and height.

I don't think you mentioned what antenna you're putting up, did you? You can just cut a half-wave of wire and it will perform notably better than your HT did with whatever antenna you have on it.

Gee, I thought we left the Power Wars, Dead Keys, and other forms of intentional interference back on 11 Meter Chicken Band. That kind of behavior around here will get you a letter from an Official Observer IF you are lucky. I know of several repeater owners who turn the machines OFF except for scheduled nets due to this kind of garbage.

If you find it entertaining, go to 27.185 MHz.

Do you have the appropriate license that is required to operate these radios?

------ Original message------From: tcarrillo915@yahoo.com [baofeng_uv5r] Date: Wed, Aug 12, 2015 12:37 AMTo: baofeng_uv5r@yahoogroups.com;Subject:[baofeng_uv5r] Can you hear me??????

I just recently found out how to program my radio. Only problem is I can here people talking green light goes on when they transmit. But they don't here me a red light comes on and a Orange background. I was wondering if there is a special tone or something I have to do to my radio do they can hear me. Also where can I find that info. Tones ctss etc.

Not here it goes on for awhile

However the repeater owner is trying to clean it up. Most of them are probably CB’ers in the day.

It is entertaining because we are getting decent training using a Pico-dop system to track down some of the jamming.

T-hunting is entertaining for some of us, gives us a chance to play with our equipment.

Quite entertaining to listen to

Gee, I thought we left the Power Wars, Dead Keys, and other forms of intentional interference back on 11 Meter Chicken Band. That kind of behavior around here will get you a letter from an Official Observer IF you are lucky. I know of several repeater owners who turn the machines OFF except for scheduled nets due to this kind of garbage.

If you find it entertaining, go to 27.185 MHz.

Well, Hollywood script writers are looking at this channel for a reality TV show.

I guess they found it entertaining enough to think about making it in a show.

And.. they are trying to clean it up .. Some of us have volunteered to T hunt for some of jamming stuff going on.

Entertaining = a very loose word in this case I should have used “shocking” instead.

If it has already been answered I apologize. What kind of antenna are you feeding? Sounds like good coax. You stated in the trees, is it a slim Jim? Todd antenna but keep it clear of branches.

Most likely we are talking about rx GMRS stations that are on repeater pairs and the wrong tone and offset is placed in.

Here the GMRS repeaters often use a digital code on the tx side with a tone code on the rx. This keeps the number of unlicensed users with their Boafeng’s off of those repeaters.

It keeps them guessing at least.... and yes I do have a GMRS license if anyone is interested.

I bet you this question is about GMRS freqs which of course we all know is Part 95 and the radio cannot be used.

Subject: Re: [baofeng_uv5r] Can you hear me??????

You could be transmitting on the wrong frequency.

You could be too far away.

But the most likely reason is that they are using a receive CTCSS tone
(or receive DCS code) to limit their reception to only radios that are
transmitting that matching tone(code). Until you program your radio
with and transmit the matching CTCSS tone (DCS code), they will not
hear you. That's how it works, and why it is used.

If the rigs circuits are designed for the impedance of the coax, there is no reflection from the rig.

I can imagine the loss at UHF

My suggestion is get a different cable to run for this project if you’re going to use a 5W UV5R or even a mobile.

Plus he did not mention how much of the 80 feet will be horizontal before he starts getting some height on the run.

A decent cable and antenna might make this worth it.

Bob WA2EGP

On Aug 12, 2015, at 10:08, "Black Michael mdblack98@... [baofeng_uv5r]" <baofeng_uv5r@yahoogroups.com> wrote:

I do believe CG-1889 is RG-213 so you're at 2.8dB per 100ft for 144MHz or about half the power is lost traveling one pass through the coax.

And that loss calculation assumes an SWR of 1 because if you also get reflected power from the antenna you lose more as the signal bounces back and forth.

e.g.
10W -- 3dB coax loss -- SWR 1 = 2.5W out
10W -- 3dB coax loss -- SWR 2 = 2.5W,

With SWR 2 -- At antenna -- 5W becomes 2.5W an d reflects 11.1% or 0.2775W,

One the way back to the rig loses 3dB and becomes 0.13875W at rig
Rig reflects back and another 3dB loss means 0.069W at antenna
Antenna reflects back 11.1% again or 0.008W and we can pretty much stop there as we're in the noise.

So you end up with 2.5W - 0.2775W + 0.13875W or 2.36125W

If your SWR is < 3 you'll probably gain quite a bit moving the antenna up high even with the ~50% loss. Amplifier probably not necessary.
A 3dB loss or so is easily made up by a better antenna and height.

I don't think you mentioned what antenna you're putting up, did you? You can just cut a half-wave of wire and it will perform notably better than your HT did with whatever antenna you have on it.

In a poorly designed rig I might agree. But where do propose the wattage be dissipated when it's returned? The radio isn't resonant on any band so it's not radiating it.
In particular if you run a high SWR load I have heard of some rigs not particularly caring for the returned power and frying the finals (e.g. UV-5R).
But if all rigs took whatever wattage was returned and dissipated it seems like a lot of rigs would be fried.
My understanding is that yes, you may be matched at the connector, but you don't have an antenna on the other side so it reflects.

If you have any reason to be on that frequency someone would have told you the tone or you would know where to get it.

These radios are legal on amateur radio frequencies, but you need to have an amateur radio operator license. The tone for amateur repeaters that are "open" are generally published right along with the frequency.

These radios are legal on "Part 90" (business) frequencies. You don't need an individual license, but the business needs a license and you need individual permission from the business to be using their frequencies. If they gave you permission they would tell you the tone.

These radios are illegal on GMRS, FRS, and MURS. There are ways to find the tone that someone is using, but honest operators are generally unwilling to help criminals who choose to break the law by using the radio illegally.

If it matches, it doesn't reflect. Period. Basic physics of a boundary between two "different" media. Works incoming the same as outgoing. The energy goes into the final and is dissipated as heat. Transistors don't like heat (neither do vacuum tubes). If there's reactance in the antenna, the reflected wave has it's voltage and current peaks out of phase and the superposition with the outgoing wave can create voltage and current peaks that can pop a transistor junction or just melt the silicon. Can we say "ping" (or Fourth of July in a bottle)? Unfortunately, I've done both in the past. (Grin)

Been a load of great replies on here, and the advice will help a great deal with a decent radio.

But unless you live in the middle of nowhere, and there are no other radio transmitters nearby, a bigger antenna is going to cause you a great deal of grief if you use a UV-5R.

The '5R has a really wide front end on the receiver, and it readily overloads. In short, the UV-5R receiver is a pile of c**p!

BUT..... It really does make a terrific handheld, using its own "set top" antenna, and I love 'em so much, I have three...!

Horses for courses.....

If your bank balance will not run to a better radio, check out the use of quarter wave stubs, and how the shorted variety can make a very good band pass filter. It won't help much if other hams give you grief, but it will help a great deal if you are getting hit from other services. And... Since it is made from coax, it can be very cheap to make. The better the coax, the tighter the band pass filter.

Enjoy your radio, I do, best radios I ever had due to the fun I have with them. Cheap, cheerful, and always in the pocket...

HTH,

73 de Stan, G4EGH

Sorry for not answering more on the thread I started. My work keeps me on the road all over the state throughout the week. I was going to either build an antenna or hang a 14" antenna from a high tree. Going through options. I just need to communicate with a repeater about 25-30 miles away.

If you want the 2 meter ham band, the length is 19 inches not 14.

Yes, we do. A minor point really. What does the reflected wave reflect from when it hits the transmitter? Not answered. If a reflected wave gets to the rig, the matching network converts 50 ohms to whatever the final's impedance is. Like a transformer, it works both ways. HTs, like our favorite, have finals that are able to take voltages greater than the battery voltage to prevent them from breaking down due to high SWR from the antenna. Good practice is the final transistor breakdown voltage is greater than 4X supply voltage. With good coax only do you lose less signal but if you monitor the SWR, you can more easily see changes in the antenna like wind damage, corrosion and other nasty surprises.

Snip******Here on one of the repeaters a jamming and “biggest radio” war has started with many involved building their own antennas to get something over the next guy. When they try to talk they just key over them.
*****

I sure hope those antics are on gmrs or such and not amateur. Sounds like kid C.B. games of the 70's....

AS far as feeding an antenna in a high tree is concerned ,(on vhf for sure) any good quality rg-8 style coax and ANY decent antenna will be a HUGE improvement over the stock duck antenna for nearly anything. If its rg-58, dont waste your time.

Yeah, I agree with the rules. But this guy doesn’t want to walk on our turf, and we’re not responsible for GMRS, FRS, or MURS, speaking as a licensed amateur. He’s been given the help he requested. There’s no need to hit everybody that asks about the other services with the whole legality thing; they’ve already bought the radio. If you have to respond to him, tell him what he needs to know. But, in general, you really don’t have to respond.

I agree about the Baofeng front ends. I had to configure PL codes on the receive side of all repeater channels because of interference from not so near by frequencies coming in. That was just connecting to a 20 foot high j-pole with 18 feet of RG58.

---In baofeng_uv5r@yahoogroups.com, <stanwhite_snr@...> wrote :

Been a load of great replies on here, and the advice will help a great deal with a decent radio.

But unless you live in the middle of nowhere, and there are no other radio transmitters nearby, a bigger antenna is going to cause you a great deal of grief if you use a UV-5R.

The '5R has a really wide front end on the receiver, and it readily overloads. In short, the UV-5R receiver is a pile of c**p!

BUT..... It really does make a terrific handheld, using its own "set top" antenna, and I love 'em so much, I have three...!

Horses for courses.....

If your bank balance will not run to a better radio, check out the use of quarter wave stubs, and how the shorted variety can make a very good band pass filter. It won't help much if other hams give you grief, but it will help a great deal if you are getting hit from other services. And... Since it is made from coax, it can be very cheap to make. The better the coax, the tighter the band pass filter.

Enjoy your radio, I do, best radios I ever had due to the fun I have with them. Cheap, cheerful, and always in the pocket...

HTH,

His question is a standard one I get at least a dozen of times at the vendor radio tables.

That is why I guessed easily that he could hear a real GMRS repeater output (which is loud and clear) but could not get into the repeater.

This is a very common question and some that ask this, actually spent the $90 for the GMRS license. Too bad it cannot be used for GMRS which is the correct answer I give at the tables.

Hello all,

An update.
On July 13th I ordered the UV-5RTP from radioddity.com (thanks James, w8jvf).

While waiting for it, I opened up my UV5R. The mic issue was indeed the connector failing (as my multimeter confirmed). So I did the solder mod as the youtube video. Worked well after that, minus the small issue that the mic is 'hot' when using my external mic. Nothing a little ball of blue-tac wont fix. :)

I received the 5RTP July 29th. So far so good. Works well.
I can't confirm the actual power, but it does seem to perform better using it portable in the city, where the old UV5R had issues at the same locations.

I can also confirm the V85 antenna is all it's said to be. It works at least as well as my old Nagoya NA701 (which I lost..), and might even be better on UHF.

I haven't had a chance to use it on a SOTA yet, but I assume it will be prone to overload just as the original was. That really is where the Yaesu HT perform much better than these Chinese radios. You get what you pay for..

I'd like to thank evevyone for their assistance, in particular James w8jvf, Jim KC9HI and John LaMartina.

Oh, I forgot to mention one thing though. Not all accessories from my old UV5R fit, in particular the extended battery, and my battery eliminator. Even my old BL-5 barely fits, unless I really push it in there to get it to click.
I guess I will have to look into the mods to do to my extended battery, and to the battery eliminator as well.

If you're talking about the whole "tight fit" with the release at the top, you just need to work it a few times. My extended batteries fit quite well after working them in an out a few times. Battery eliminator, same story.

Yes, that's what I'm talking about. I've tried it over and over.
The old BL-5 fits (tight) now, but the extended and eliminator wont fit.

The eliminator almost fits.. enough to hold it, but not enough to "click" the release at the top. The extended battery won't hold at all. They must have changed something, or maybe it's the way my 5RTP was assembled . Time to dremel.

Well James I know this maybe is off topic but the repeater group that uses the repeater got into some shouting contest with another group here. Someone from the opposing repeater group bought 30 Baofengs and passed them out to derelicts on skid row,

They programmed only one channel and told the people they gave them to, that if they needed food, liquor or other to use the radio for delivery calls.

So what you might be listening to is some of the skid row derelicts asking for beer and other stuff.

Talk about an ingenious practical joke , that user group is waiting for the batteries to go dead and hope some of the people will go away.

Then you have the typical oddballs using it too. Every night it is like a reality TV show and rumor has it Hollywood is thinking about having a show about Ham radio as a reality show here using this repeater.

I am told they need to add more women to the mix and might actually create a TV series about this repeater and the goofy characters on it. If course the women most likely will be attractive to bring in the viewership.

This repeater is for the misfits of Ham radio basically.

At first I though not even the skid row folks would be that stupid (as to believe their food and cheap liquor needs would be met by calling for a delivery over the radio), but then again this is the same state that re-elected Jerry "Moonbeam" Brown as their Governor, wants to build a $68 billion dollar bullet train (in some cases along fault lines), and can't provide enough clean water to their citizens. Yup, if any group could believe they're able to get food and liquor delivered by radio dispatch, it would be the comrades from the Kalifornia.

Are you Frustrated with that generic programming cable?
Here is a $2 solution might just be your ticket to sanity.

It's a simple project that utilizes a CP2102 board.
Say goodbye to the backdated driver issues.

Instructions and graphics can be found at:
Build a Progr Cable - Miklor http://www.miklor.com/COM/UV_ProgrCable.php

I live just a few miles from this repeater. Most of we Hams here in the San Fernando Valley, just north of LA, feel that while it would be a good thing were the FCC to crack down on these knuckleheads, we also feel that since they're limiting the shenanigans to just one repeater, and not bothering everyone on any other repeater, we're OK with them having their own little "sandbox" to play in.

I know it's likely the radio but in the off chance.....when the person gets done talking, it takes several seconds to resume scanning. Is there any way to speed that up or is that the way it is.

THANKS!

My guess is that you are selecting UV-5R when for a radio with 3 power
levels you should be selecting BF-F8HP.

From the CHIRP home/wiki page:

BF-F8HP (in daily builds)
Also includes the BF-A58
Also includes the BF-F9V2+
Also includes the GT-3TP
Also includes the UV-5RTP
Also includes the UV-5R7W

Yes, Change menu 18 from TO (Time Out) to (CO) Carrier Operation. Then once the carrier drops the scanning will resume immediately. instead of waiting for a time out to complete With this mode though you cannot follow a back and forth conversation unless they keep the repeater carrier up at all times.

I have Windows 10, 64-bit, and Chirp, and I followed this link to get things working.

Family Software Drag Racing - Newsletter#37, Prolific PL-2303 Driver Solution for Code 10
http://www.ifamilysoftware.com/news37.html

The problem is probably that most of us appear to have counterfeit Prolific programming cables. The simple procedure outlined on the page above worked for me.

I have only the single "Prolific" USB-serial cable, so I do not know what this driver update will do to a real Prolific cable that is on the same computer as the bogus one from Baofeng.

My testing has shown that this device driver (v3.3.2.102 if I remember) and one other device driver (v3.3.2.105) are the only device drivers newer than v3.2.0.0 that will work with a programming cable that contain unauthorized Prolific chip copy. There is nothing wrong with using them if the only programming software that you expect to use is CHIRP.

The reason that the v3.2.0.0 device driver is recommended over the 2 newer device drivers it because the newer ones don't play well with the Baofeng programming software.

Microsoft could care less about complaints unless you vote with your
wallet. When (if?) the public starts buying more Mac's or Linux machines
then (and only then) will Microsoft care. Since we are talking about a
tiny fraction of their user base that's affected by serial to USB cable
issues, I really doubt the numbers of complaints will ever amount to enough
for them to care one little bit.

52190. New Member introduction

Yahoo group: baofeng_uv5r (2015)
Date: 2015-08-20 02:34:26 UTC
From: Phil
Topic: 52190 Message: 52190

Hi,
I'm "Phil, KO6BB" and I'm new to this list, but NOT to radio as I've been 'radioactive' one way or another since around 1953.

I'm not 'into' repeaters all that much, my interests lie more in the Longwave beacon area and HF in general. But I have had more than a few VHF/UHF rigs, both HTs and mobiles.

My favorite HT by far is the Yaesu FT-60 (I LOVE Yaesu radio's ease of programming). I've had a couple FT-60s and swapped my last one for an HF receiver a couple years back. Still have that receiver, but I always wanted another FT-60 for when I go for my morning walks. Alas, they're rather dear in price for a retired old phart. . .

I've been eyeing the Baofeng radios for a few months, though the ones I've heard on the air through our local repeater (on the Yaesu Base statgion) seem to vary widely in their audio from pretty good to downright lousy! It seems like it's a crap-shoot if you get a good one (don't take me wrong, they're at a good price point).

Today I was up on Amazon to purchase a couple electronics items, a digital LCR meter for measuring coils I wind for Homebrewed radio projects (I have built radios since I was 10, about 1953) and also needed a couple other small items.

When an Amazon ad for the Baofeng UV5R (yeah, I know, not their top line model) popped up selling it for $25.88 I decided to jump on it. I also bought their little speaker/mic for $5.82 and the USB cable/programming software for another $5.40. All in all the total is only just over $37.00, AND FREE SHIPPING! How can I beat that???

I'm hoping that the unit will hit my local repeater just fine without having to buy a better antenna. The W6BXN repeater on Mt Bullion is pretty easy to hit from here, and we have a remote receiver right here in town. That's the Turlock ARC repeater and it has remote receivers all over the place, even in Yosemite National park. Anyway, like I said, hope the factory duck will work OK as I went over what we budgeted for "my toys" today (budget is pretty tight). . .

As to programming the critter. I've been reading about those FTDI chips. I'm sure that the cable I ordered probably has a fake one :(This machine is running 64 bit Windows 10, my emergency Acer backup-laptop (very rarely used) still has 32 bit Windows 7 on it, it came with Vista. The wife's 'puter is the same Acer model and still runs Vista (I bought two of those Acer Laptops a number of years ago when they were on a clearance sale).

So I 'should' be able to get one of the three machines to work on the Programming cable. . .

Just for fun, I talked with RT Systems today to see what (if any) changes I would need to make in order to support Windows 10 "if" I upgrade. Their response? Our radio programming software and cables are fully supported in Windows 10, so no worries.

Again, it originally cost me some money for their product, but from my days using Windows XP, then the nightmare OS called Vista, then into Windows 7, and now into Windows 8.1 - no support or configuration issues programming any radios. It appears that will continue with Windows 10. IMO, I'd say that was money well spent.

even if you get a bad cable, these units are simple to program from the
front panel.

Definitely. I got a RT Systems cable for one of my HTs in a thrift store for $3. Yep. Talk about a surprise. But it worked flawlessly. Guess they didn't know what they had. Didn't need it (have a programming cable already) but picked it up because of the name and wanted to see how we'll it worked.

My comment was referring to manual programming. I have only one HT that requires a programming cable, no keys. Got a "generic" cable and downloaded the Relm (HT brand) software. Works fine. Even programs the Baofeng.

> Just for fun, I talked with RT Systems today to see what (if any) changes I would need to make in order to support Windows 10 "if" I upgrade. Their response? Our radio programming software and cables are fully supported in Windows 10, so no worries.
>
> Again, it originally cost me some money for their product, but from my days using Windows XP, then the nightmare OS called Vista, then into Windows 7, and now into Windows 8.1 - no support or configuration issues programming any radios. It appears that will continue with Windows 10. IMO, I'd say that was money well spent.

Good morning Phil:
Good to hear you on this group. I have had several Baofeng UV5R Radios and mine have worked fine. I use Chrip program for loading and unloading the fequencies being used. It works great and is a free download. When I run into a problem, which is not very often, with the Baofeng I usually call Grady Williams and he has been helpful.
Good to hear you again. Mike Kelly AA6MK

  Hi,
I'm "Phil, KO6BB" and I'm new to this list, but NOT to radio as I've been 'radioactive' one way or another since around 1953.

I'm not 'into' repeaters all that much, my interests lie more in the Longwave beacon area and HF in general. But I have had more than a few VHF/UHF rigs, both HTs and mobiles.

My favorite HT by far is the Yaesu FT-60 (I LOVE Yaesu radio's ease of programming). I've had a couple FT-60s and swapped my last one for an HF receiver a couple years back. Still have that receiver, but I always wanted another FT-60 for when I go for my morning walks. Alas, they're rather dear in price for a retired old phart. . .

I've been eyeing the Baofeng radios for a few months, though the ones I've heard on the air through our local repeater (on the Yaesu Base statgion) seem to vary widely in their audio from pretty good to downright lousy! It seems like it's a crap-shoot if you get a good one (don't take me wrong, they're at a good price point).

Today I was up on Amazon to purchase a couple electronics items, a digital LCR meter for measuring coils I wind for Homebrewed radio projects (I have built radios since I was 10, about 1953) and also needed a couple other small items.

When an Amazon ad for the Baofeng UV5R (yeah, I know, not their top line model) popped up selling it for $25.88 I decided to jump on it. I also bought their little speaker/mic for $5.82 and the USB cable/programming software for another $5.40. All in all the total is only just over $37.00, AND FREE SHIPPING! How can I beat that???

I'm hoping that the unit will hit my local repeater just fine without having to buy a better antenna. The W6BXN repeater on Mt Bullion is pretty easy to hit from here, and we have a remote receiver right here in town. That's the Turlock ARC repeater and it has remote receivers all over the place, even in Yosemite National park. Anyway, like I said, hope the factory duck will work OK as I went over what we budgeted for "my toys" today (budget is pretty tight). . .

As to programming the critter. I've been reading about those FTDI chips. I'm sure that the cable I ordered probably has a fake one :(This machine is running 64 bit Windows 10, my emergency Acer backup-laptop (very rarely used) still has 32 bit Windows 7 on it, it came with Vista. The wife's 'puter is the same Acer model and still runs Vista (I bought two of those Acer Laptops a number of years ago when they were on a clearance sale).

So I 'should' be able to get one of the three machines to work on the Programming cable. . .

Dear Phil,
Welcome to the list.
I grew up on CB, and some of my experiences there don't convert to
Baofeng. With CB, a roof antenna makes a handi talkie perform a lot better.
As to antennas, I invested in several long or magnet mount
antennas. Come to find that for some reason the receive (on Baofeng)
blanks out when I use a longer or roof mount antenna.

My experience is to use the factory antenna, and not use longer or
roof mount antennas. At least, that in urban areas and factory parking
lots. I've got several antennas, but they all make the receive go silent.
One friend of mine who lives out in the wood uses a longer antenna
to reach the repeater.

But most do - if you understand those experiences

> With CB, a roof antenna makes a handi talkie
> perform a lot better.

And EXACTLY the same is true of the BaoFeng UV-5R

The problem that people complain about when putting a better antenna on the UV-5R is what a CBer would have called "bleed over" -- and with a CB radio, using a better antenna would have increased bleed over exactly the same as it does with a UV-5R
